By-Products from Stamp Mills.—In the process of amalgamation we have the inside copper plates, the screens through which the pulp passes and the outside copper plates, brushes and rags that are used to clean the plates with, the screen frames, mortar boxes, shoes and dies; all these come in contact with the gold and quicksilver and take up more or less amalgam. The ordinary cleanup gives the plate scrapings, which contain, besides the gold amalgam, particles of iron, sand, iron pyrites, especially magnetic iron pyrites when present, bits of copper, sometimes a little grease, and various colored metallic films that spread over the plates as a result of the decomposition of pyrites and other sulphur compounds. This amalgam is then cleaned by grinding and washing, generally in an amalgamating barrel with various chemicals, such as lime, cyanide of potassium, and other chemicals special to the individual amalgamator. Into this barrel is also put the ashes which result from the burning of the chips, rags, brushes, scalings from the screens, the cleanings round the dies, and all the odds and ends round the amalgamating room that may contain a little amalgam. As a rule this barrel is a grinding barrel, and its products at the finish of the operation are clean amalgam, fine silica, slime, and water containing various chemicals. At many of the best mills, when the barrel is empty all these various products are saved, because complete amalgamation of all the gold contained in the barrel has not by any means taken place. Some of the quicksilver has been floured, some of the hard amalgam has been ground up into an impalpable powder, and in the grinding up of the pyrites some of the amalgam adhering to the fine grains of the pyrites is floured. Where cyanide has been used, which is frequently the case, some of this floured gold has been dissolved. Hence, besides looking after the amalgam from this barrel, the sands and slimes should be most carefully settled and the water drained into a collecting tank filled with scrap iron, old zinc, cyanide cases, bits of screen from the battery—in fact, any old scrap iron that may be about that might contain gold. This tank is acidulated with sulphuric acid, and the sludge from it, in addition to the slime and sand settled from the washing of the amalgam, can be sent away for treatment. The value of this product will vary from 50 to 300 ounces to the ton. The sludge tank should be cleaned up once or twice a year, and the sands and slimes twice or four times a year, according to the size of mill. The above remarks apply to any form of grinding-pan or other machine for cleaning amalgam. The value of this product and the weight obtained varies, of course, with the size of the mill and the richness of the ores. In a 100-stamp mill from 40 to 50 ounces may be easily obtained from this source per month. In many mills this material is run straight to waste. The screens, after being rusted and beaten, still contain about two ounces to the ton, and can be readily sold as a blast furnace flux or worked up for ferrous sulphate in a chlorination works, and the sludge from this afterwards treated. The copper sufficient being worn out and being cast to one side, still contain, after the most careful scaling, plates upon gold to make them worth more for their gold contents than for their copper value. These should always be sold to a refinery. The iron chips, which are known as battery chips, always contain more or less amalgam, even after the most careful rusting and cleaning. A very efficient and cheap way of rusting battery chips, old screens, and any old iron that may be suspected of containing amalgam, is to make a bed of clean concentrates — that is, concentrates containing as much sulphur as possible—and bed the screens and chips in alternate layers of screens, chips and concentrates, and keep his bed watered with a solution of warm water and salt for about a month or six weeks. At the end of that time, if this has been done in a warm place near a boiler furnace, or, if that is not obtainable, under a glass frame, in the same way as a forcing bed for flowers would be arranged, this material can be dried and put through a ball mill. What iron is left from the chips, or pieces of iron, would be so deeply rusted that all amalgam is scaled off, and the screens will be found to have disappeared and pulverized. This product is then available for the blast furnace or chlorination works. The gold obtained from these various sources is quite sufficient to warrant the serious attention of the amalgamator.

By-Products from Cyanide Works.—The by-products that are obtained from the cyanide works are very much less in the case of fresh unoxidized ores than from acid or partly oxidized ores. Where the ores crushed have been exposed to atmospheric influences and are partly weathered the products of incomplete decomposition of the iron compounds always introduces a series of complications in the solution and precipitation of the gold that increases the amount of by-products, whether the gold so dissolved is precipitated by chemical or electrical agency. In the case of the unweathered pyritic ore, or of perfectly oxidized ore, a solution is obtained comparatively free of iron salts, but in the case of a partially oxidized ore the ferrous and ferric salts produced form, with cyanide and alkali, ferrocyanides and ferrous and ferric hydrates. These diminish the efficiency, more especially of the chemical precipitating agency, and also increase the amount of sludge obtained from the electrical precipitation boxes. In the case of these acid ores a comparatively large amount of lime is needed, which, going into solution in the shape of hydrate, carbonate and sulphate of lime, crystallizes out in the zinc box and in the electrical precipitating box upon almost everything that it comes in contact with, more or less destroying the precipitating surfaces. This is a serious difficulty in the treatment of acid slimes. The surfaces of the lead cathode are almost completely covered after a few weeks by these comparatively insoluble lime salts, which gradually slip off the lead surfaces. By carrying down gold they thus tend to enrich the precipitates in the bottom of the boxes, as well as the floating precipitates which pass through the boxes and out into the sump. In zinc precipitation everything that accumulates in the box in the way of slime is taken as the main cleanup. The particles which flow away from the box in mechanical suspension in the form of insoluble complex cyanides and hydrates, clayey matter, insoluble humus which has been precipitated from humic acid, and, in fact, any flocculent precipitates that may float through the box, will always carry gold along with them, which may be partly deposited in the sump. Hence one might properly say the only by-product produced directly from the zinc precipitation boxes, outside of the products resulting from the treatment of the zinc slimes, are the precipitates obtained from either the settlement of the precipitated liquors, or the precipitate obtained by filtration of all the liquids after passing through the zinc box. Under ordinary conditions, in a well-conducted cyanide works treating fresh ores, filtration of the precipitated solutions merely to obtain the floating matter from the zinc boxes would not pay, but where acid ores are treated, the precipitated sludge obtained from the sumps is of sufficient importance to warrant its careful collection. This precipitate varies in value from 1 up to 20 oz. to the ton. Precipitates so obtained from the Simmer and Jack cyanide works, where fresh pyritic ores have been treated, assayed 2 oz. 18 dwts. During the precipitation of rich solutions, running from 5 oz. to 8 oz. to the ton, flocculent precipitates assaying 14 oz. per ton, and composed of zinc cyanide and zinc ferro-cyanide, insoluble in the dilute liquor used, were carried over into the sumps. A skimming taken from the top of the treated tank partly mixed with exhausted residue gave an assay of 16 dwts. per ton, due mainly to finely divided precipitated gold which had been pumped back. Black skimmings of organic matter, resulting in the same way from the filtering through sand of precipitated liquors, gave an assay of 5 dwts. per ton. I consider it worth the attention of cyanide managers to see that the sumps are regularly cleaned of sludge, which may be dried by pouring into a small enclosure or dam made of tailings in the open air. After two or three weeks this material is dry enough to sample and assay, and in nearly every case will be found rich enough to sell to the smelting works. The gold in precipitates so obtained is not easily soluble in cyanide solutions unless special preparation is given to their proper oxidation, either by means of preliminary roasting or long-continued exposure to aeration and agitation with cyanide solution in an agitating vat. At one of the earliest meetings of the society it was mentioned that 300 oz. of gold were recovered from the sludge in the sumps at certain works.

By-Products Obtained from Siemens and Halske's Precipitation Boxes.—In the Siemens and Halske boxes the main clean-up is obtained from the melting of the lead cathodes. Whatever else is obtained from the box in the shape of gold is termed gold from by-products. The sources of these by-products are the insoluble compounds of iron and cyanogen. The iron of the anode oxidizes, forming ferrous hydrate, which partly unites with the cyanide in the solution forming ferro-cyanide, from which Prussian blue is derived, and partly undergoes further oxidation to ferric hydrate. A portion of these precipitates settles in the bottoms of the boxes and a portion floats through them into the sump, where they become by degrees oxidized to the ferric state. This precipitate also adheres to and saturates the sacking which covers the iron plate; when, after long usage, this sacking becomes rotten, it is removed and burnt, and the anodes are likewise carefully scaled of oxide. The value of the Prussian blue, of the ashes resulting from the burning of the sacks and of the scalings of the plates vary with the care and regularity with which the process has been carried on. In a sand plant where all the solutions come filtered clear to the boxes the Prussian blue may be cleaned up for sale every two months, and may contain from five to fifty ounces to the ton. The product from the sacks and the plates, which is obtained once every one or two years, may have about the same average value as the Prussian blue. The value of these by-products has averaged so far at the Worcester, which is the oldest Siemens and Halske sand plant, about 25 ounces for scalings in 1895 and 21 ounces for scalings in 1896, 21 ozs. for Prussian blue in 1895, and 9 ozs. for Prussian blue in 1896. In a slime plant the difficulty of obtaining an absolutely clear liquid for precipitation introduces a certain amount of ore slime, which becomes mixed with the Prussian blue in, thereby increasing the quantity and decreasing the value of this product. With fresh slimes a clearer liquid and less mud is introduced into the precipitation boxes than with acid slimes. What with mud from imperfect settlement, precipitated lime salts, and the formation of insoluble sulphates and hydrates and complex cyanides, any precipitation process, no matter how perfect, is very much handicapped. To prevent this state of affairs in the precipitation boxes I am now constructing sand filters to clarify the liquid before precipitation. When a sand and slimes plant are worked together, as at the Bonanza, a large proportion of the solutions decanted off from the slimes can be clarified by passing through the sand vats as a wash. The precipitates which form in the boxes themselves do not have nearly so bad an effect as the introduction of a small amount of finely divided silica or clay. While there may not be over one ounce to the ton of finely-suspended siliceous slime in the liquid flowing through the box, still this small quantity coats both the anode and cathode with a fine film of non-conducting material, thus preventing the gold from adhering firmly to the cathode, as well as raising the voltage in the box. Hence the clarification of the solutions, whether from fresh or accumulated slimes, will tend to reduce the amount of by-products, which must be sold and increase the percentage of gold directly obtained by the melting of the lead strips.

Siemens and Halske Melting Room By-Product.—The melting of the Siemens and Halske strips is generally done in a small reverberatory furnace, about 5 feet by 2 feet 6 inches. If this lead is fairly clean and free from siliceous mud and iron salts a quick clean melting takes place, and at the end of the operation a little powdered coal may be spread over the surface of the oxidized bath and the temperature raised to as high a point as possible; afterwards the furnace is allowed to cool down and the lead tapped into moulds. In addition to the clean lead obtained from this melting, which may run from .5 per cent up to 10 per cent in gold, there is obtained a clean liquid slag which is mostly litharge, or in the case of dirty lead strips the temperature obtained is not sufficient to slag this, and a pulverulent residue is left in the furnace which is known as "skimmings." Generally, where it is necessary to make more than one melting for a cleanup, all the skimmings resulting from previous meltings are put into the furnace and the furnace is brought to as high a temperature as possible, and the skimmings are sweated of their remaining lead contents. When every drop of lead has been drained from them that can be obtained, the hot skimmings are raked out and allowed to cool. These skimmings are then ground in a Chilean edge-roller mill and screened through a screen of about eight holes to the linear inch, from which two by-products are obtained, known as "coarse metallics" and "ground skimmings." The coarse metallics are melted in a pot and yield one or two bars of lead. The lead bars obtained from the melting furnace are then remelted in an iron melting, carefully skimmed, and poured into moulds. The skimmings obtained from this melting pot are added to the first lot of the skimmings obtained from the reverberatory furnace. All the lead, whether obtained directly as bars from the reverberatory furnace or from melting the coarse metallics, is considered lead bullion, and only the skimmings are known as "by-products," for the reason that the skimmings must be remelted in a pan furnace before their contents are obtained as lead bullion. Under careful treatment the amount of gold obtained in the skimmings may be reduced to under 1 per cent. The cupellation of this bullion produces another set of by-products, amounting to about ¼ per cent, which are known as the "refinery by-products."

Chlorination Works By-Products.— The only by-product which is obtained from chlorination works is the sludge which is cleaned up once or twice a year from the second set of precipitation vats. In the precipitation of gold from chlorine solutions, by means of sulphate of iron, the presence of certain salts in the solution prevent complete precipitation of the gold, and in addition to that there always remains a certain amount of suspended gold in the liquids. Sufficient time for complete settlement is seldom given. In some works the precipitated liquor is drawn off from the gold twenty-four hours after precipitation; in other works forty-eight hours are given. I rarely draw it off before seventy-two hours. In some cases this liquor is passed through the filter press. Either long settlement or the filter pressing of the liquor will reduce its assay value, which, however, will still vary with the salts which are contained in it. At our works, after seventy-two hours, the assay value of the liquor is from 4 to 12 grains; if there is much copper present, an average of about 2 dwts. may be expected. The presence of lime also tends to give a higher value. The

* Chemical and Metallurgical Society of South Africa.

precipitation of very dilute liquors of from 2 dwts to 3 dwts. is frequently very imperfect with $FeSO_4$. Precipitation by means of hydrogen sulphide gives the lowest residue. This acid liquor, when drawn off from the precipitated gold and placed in tanks filled with scrap iron, rapidly decomposes, yielding a precipitate of gold, copper and basic iron sulphates and hydrates. In a temperate climate, at the end of a week, the liquor can be run to waste assaying not over two grains; in a cold climate these vats are generally enclosed in a house, and slightly warmed by steam. The sludge obtained from these final precipitation vats is worth from 1s. to 8s. per ton of ore treated, and no chlorination works is considered complete without them. In California the gold obtained from this sludge is equivalent to about 2 per cent to 2½ per cent of the total gold obtained in the chlorination works. The by-products obtained from melting the slimes are very small, because in well-conducted works the slime is nearly pure gold. The treatment of the slag produced will be mentioned under the heading of "melting room by-products."

By-Products of the Melting Room.—The product taken to the melting room from the chlorination works is slime which has been treated by sulphuric acid and carefully washed, and may contain from 25 per cent to 90 per cent of gold. In the handling and melting of this there is a certain loss of gold which is left on the hands and tools when mixing with fluxes; and a certain amount is lost in transferring to the crucible in the slag, in the mould, and in the sink where the bar is scrubbed and cleaned. From every one of these sources of loss ultimately the bulk of the gold can be recovered. All the above remarks apply also to the precipitates obtained from zinc boxes. In every melting room there should be a couple of tanks holding from 100 to 200 gallons of water. All the washings from the tools and hands and from the sink where the bar is cleaned should be thrown in this tank. At the end of every four or five months this liquid should be carefully drawn off after assaying, and the precipitate cleaned up. I have known as high as 200 ounces taken from a tank of this description. At the end of the year, even with the most careful work, the tank in the melting room is always a source of profit. The pots may be scaled and the scalings melted after grinding; after most careful scaling the pots will still be found to contain from 20 to 40 ounces to the ton. The ashes and flue dust from the melting furnaces may be cleaned up and the former will be found to contain on an average about 5 ounces to the ton; along with the pots they form the most refractory material with which the smelter has to deal. The slag from melting zinc gold slimes, after grinding and panning, will assay from 25 to 200 ounces to the ton; an average of 50 ounces to the ton is generally what is found here. Unless the zinc slimes have been treated by the acid process, the slags are by far the most important by-product of the melting room. In case the slimes have been treated by the acid process, the thin lead matte which is found upon the bar after pouring has been found to contain about 14 per cent gold. Finally, the furnace in which the material has been either roasted or melted becomes saturated with gold, and when renovations take place all brickwork and mortar of the furnace, as well as the brickwork of the floor, will give an average value of about 20 ounces to the ton. Where mill gold only is handled, only the immediate lining of the furnace is valuable. In the panning of the ground slags for the coarse gold, which is sometimes done here in small rockers or on incline tables, I have frequently noticed that only the coarse particles of this ground slag is saved, and the finer particles or slimes flowing away with the water are allowed to go to waste. Quite 20 per cent or 25 per cent of the ground slag goes into slimes, and this assays just as high as the coarser particles. No water should be allowed to flow to waste when the slags are washed, but should all be retained in tanks for clear settlement and subsequent cleaning and drying of the settled slimes. The cemented or iron floor of the melting room should be kept scrupulously clean and the sweepings carefully saved, as they will invariably assay over 5 ounces to the ton.

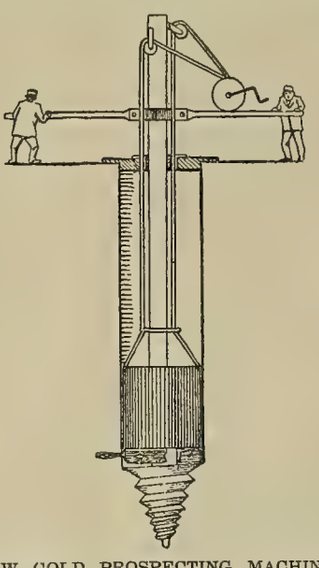
The attention of managers and directors should be given to these sources of income, and regular quarterly account sales of these by-products should be required. Too frequently the battery is utilized as the great sewer through which these valuable products disappear, along with a large proportion of their values.

A New Prospecting Machine.

W. Schwarnweber has a patent for a prospecting machine that he thinks will obviate all difficulties arising from the frozen ground of the Yukon region.

Thus far it has been necessary for the miners to build fires on the frozen gravel of the rivers in order to remove even a few inches of dirt. Six inches deep is considered a good thaw, and fire after fire has to be kindled to make any kind of impression on the ground. The invention herewith portrayed is expected to enable two miners to prospect to a depth of 30 feet or more without the necessity of building a fire.

The device consists of a steel screw, which is

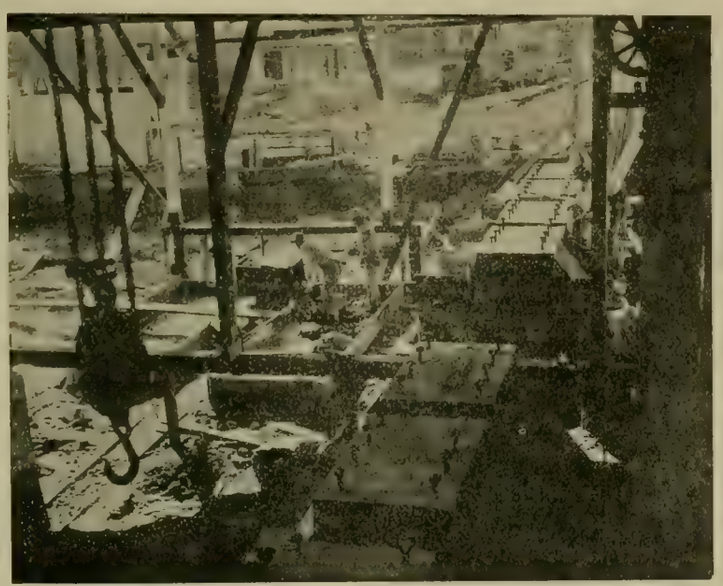


NEW GOLD PROSPECTING MACHINE.

worked into the ground like a posthole auger. A cylinder of the same diameter of the screw and 2 feet in depth follows the screw into the ground, and within the cylinder is a well bucket, which has an open bottom, into which the detached dirt and gravel are forced. When full, this bucket is elevated by a windlass attachment and can be washed out and panned, while the bucket is returned for another load.

Stamp-Mill Concrete Foundation.

In new construction of stamp mills in California, in Nevada county, Butte county, and also in the southern part of the State, there is a tendency to materially change the old-time plan and replace the timber foundations with concrete. The new 40-stamp mill, being erected by Geo. H. Evans at the Banner mine, near Oroville, California, is the latest instance of the kind that has come under our observation. Herewith are two photo-engravings of the concrete blocks, which illustrate the change. The concrete is in pyramidal form, 8 feet at the base, composed of one part of cement, two of sand, and five of course rock to a height of 3 feet. As the structure assumes an oblong form the next 6 inches is composed of one part of cement and two of fine river sand. This structure complete is 4 feet in height. The bolts for the mortars extend 6 inches above the top surface and are imbedded in the cement structure to a depth of 33 inches. The whole structure is laid on a line of solid bedrock, there being concrete sills for the 12x20-inch posts.



CONCRETE FOUNDATIONS FOR STAMP MILL.

New Explosives in Mining.

Inventors have been busy lately in the endeavor to discover a safer and cheaper explosive than gunpowder for the blasting of coal. Some interesting experiments were recently carried out at Southport, to determine the relative strength and efficacy of a new explosive. The conditions of test in each case were the same, ten grammes of the explosive being used. This was placed in a steel mortar loaded with a projectile weighing thirty-five pounds. All shots were fired at an angle of 35°, with the following result: Gunpowder threw the projectile 51 yards, kynite 88½ yards, benedite, as the new powder is called, 155 yards, and dynamite 161½ yards. Benedite contains no nitro-glycerine, and it was also subjected to severe tests as regards handling. Unlike dynamite and explosives generally, benedite could not be exploded by either a blow from a hammer or direct application of flame, an advantage which ensures perfect safety in the use and handling of the explosive. It can only be exploded by means of a detonator. For safety blasting in coal mines a series of trials have shown that when it is exploded in the presence of highly inflamable mixtures of pit gas and coal dust it would not ignite them. It is further claimed for the new safety explosive that its cost of production is much below that of powerful explosives generally, and it is to be put on the market at a considerably lower price.

During the past few years several articles have been published on the possibility and advisability of welding instead of riveting boiler plates. The advantages of employing electric welding have been fairly shown up, but so far as known no boiler maker has used the process in practical work. Two or three shops are, however, experimenting with the process, and hope to find it available for welding on the heads of tubular boilers, though they are not yet ready to make any statement regarding the success of these experiments.

Mining Summary.

CALIFORNIA.

Alpine.

The company working the Leviathan mine at Monitor has twenty men employed and expect to have 200 at work before long.

Amador.

(Special Correspondence).--While the mother lode counties are all attracting attention at this time by the number and value of the mines that are constantly being added to the dividend list, Amador justly considers herself the mother of them all. The mines of Amador were recognized as of great and proven value when those of Calaveras and Tuolumne were scoffed at and condemned as pocket mines. In fact, a number of Amador's mines had been worked to a depth of 1400 feet, and were considered worked out, before the mother lode mines of the counties to the north and south were given the recognition they have since earned and now hold.

Along the north end of the lode, in the vicinity of Plymouth, the mines are resting on their past history. Going south, at Amador City the old Keystone, under J. D. Treadwell, holds its record as the largest gold producer (with bullion receipts to verify the claim), not only on the mother lode but in the State as well. The company's books show that to date the mine has produced over $15,000,000, and, unlike most old mines, is today reopening and working her upper levels. In the past the mine was worked to a depth of 1400 feet. For some time the closing of the mine was in contemplation. A change of superintendents brought about a change in the development of the mine and proved in time that the mine held in reserve in its upper works ore bodies as large and rich as those of the mine's earliest history. At present the ore is coming from the 700-foot level, where the vein shows nearly 100 feet wide. At present the development is by upraise, winze and crosscuts. The old method of following one wall has been abandoned; when an ore body gives out another is sought above, below or on both sides. The ore bodies are not continuous, nor are they in a line, but huge lens-shaped bodies that go dodging along between the walls like a huge salmon running up a stream. The Keystone promises to hold many years of profitable fishing for ore bodies in what was considered a worked-out mine. At present the 40-stamp mill and two other mills are running steadily, the stamps on the clean quartz and the others on the gouge and slaty material. Mr. Treadwell has arranged for systematic search for ore bodies a complete history by levels of every section of the mine, which enables him at a glance to tell not only where the old levels are, where work stopped, but the character of the ground as well. This, with an extensive system of maps, places the old mine before the reader as plain as though the works were open for inspection. As is well known, the Keystone and South Spring Hill mine, adjoining, are in litigation over the apex of the lode in the South Spring Hill end of the mines.

At the South Spring Hill Consolidated, J. Tregloan superintendent, the mill has been running irregularly while the shaft was sunk to the 1200-foot level. The shaft is now down and a crosscut is being driven to the vein.

To the south, near Sutter Creek, the Mahoney is operated under bond to the Wildman Co. and forty stamps are dropping.

At the Wildman, J. Ross, Jr., superintendent, the shaft on the mine is now down 1300 feet, with a vein 3 to 75 feet in width. The Wildman and Mahoney are in charge of a thorough miner, who has rebuilt the Wildman plant, adding ten stamps, making forty on the Wildman, opened up both mines and will soon have them in excellent shape, both above and below, without calling on his company for a dollar.

On the Central Eureka, to the north of the South Eureka, W. R. Thompson as superintendent has the shaft down 950 feet and is sinking.

The South Eureka, J. Parks superintendent, is now down 1250 feet on a vein of from 6 inches to 15 feet. Twenty stamps are dropping. The company is about to change to electric power for the mill, blower and crusher.

The Pontazuba mine, S. Moyle superintendent, is situated to the north of the Baliol and about one mile southeast of Sutter Creek. The shaft is now down 550 feet in the center of the vein. Stations are now being put in and preparations made to drift both ways on the vein. A mill run of surface ore from this vein showed its value to be over $25 to the ton.

To the south is the Baliol mine, G. McM. Ross superintennent. The Baliol covers a large area. The vein is supposed to be the Zeila vein, as its location is on the east wall of the mother lode. The mine is opened by cuts on the vein, showing mineralized slate and greenstone, with a belt 100 feet wide. The open cuts are at this time about 100 feet deep. The ore is quarried out and trammed to the 40-stamp mill, where the 1000-pound stamps crush an average of 270 tons a day at a cost of 85 cents a ton for mining and milling. The company contemplates adding sixty stamps, bringing the number up to 100, when by adding steam shovels and other machinery for rapid and economical working of the large ore body Mr. Ross estimates that the cost can be reduced to 50 cents a ton. In addition to the present large ore body the mine contains the Pontazuba vein to the west, which can be added to the ore reserves at any time. Since Mr. Ross has taken hold of the property the plant has been thoroughly overhauled and the mistakes and weak spots in the construction removed, and the whole plant placed on the present extensive, economical and business basis. If there were more superintendents like these of Amador, there would be few failures on any proposition on the mother lode.

Near Jackson the Kennedy, under its superintendent, J. Parks, is now down 2275 feet, making it the deepest mine on the lode and establishing the fact that the values in the mother lode are not limited to the 1400-foot level, but if followed down can be depended upon to extend into the earth indefinitely. The vein in the mine is from 2 inches to 20 feet. The mill is of forty stamps of 850 pounds weight, crushing 100 tons a day. The superintendent is always exceedingly coy about the output of the mine, evidently believing that "good wine needs no bush." The record of the mine is thought to be only second to that of the Keystone. The mine is equipped with a chlorination plant.

The old Eureka is the property of Mrs. Hetty Green, who is content to let it lay idle notwithstanding the eagerness of many to secure the property with its large bodies of low-grade ore left standing in the upper levels, to say nothing of the vast wealth that must be below the old works.

The Argonaut, W. F. Detert general manager, adjoins the Kennedy on the south. The shaft is opened up 1350 feet and sinking going on. The vein, like that of the Kennedy, is from a few inches to 20 feet. The company is just completing the best planned mill that the writer has seen on the lode. The stamps are 950 pounds weight, forty in number, with twelve 6-foot concentrators.

The Amelia, J. E. Reese superintendent, parallels the Argonaut on the east and is better known as the old Muldoon mine. The shaft is now down 350 feet and sinking on what is thought to be the foot wall, with gouge but no vein matter. This property has come into prominence through the fact that it is now claimed that in the Amelia crops the apex of the Kennedy vein. This "fact" is disputed by the Argonaut Company, who are making connections from the bottom to the top of their works to prove that the vein they have extends to the surface inside of their side lines. As the works of the Argonaut and Kennedy connect, there can be no doubt about the location of the vein in depth. The Amelia people base their faith on the croppings, which in their mine and the Kennedy are in slate, while that of the Argonaut is in greenstone, and that crosscuts run in the Kennedy ground show that the Argonaut vein does not go down. The Argonaut Company admit that their vein crops in the greenstone, but state that it is superficial and a mere cap. The fact that the Alma, to the south of the Argonaut, crosscut ,735 feet to find the Amelia vein, in vain, makes honors easy on that score. On the Bell mine, near Tuttletown, Tuolumne county, the country rocks make the same change in depth as the Argonaut. Apparently both properties have a vein apexing on their ground. Once the Amelia people get down to the levels of the Argonaut, the question will be quickly settled as to which mine carries the Kennedy apex and vein.

At the Oneida, John Truscott superintendent, the shaft is down over 1300 feet and will be continued to 1700 or 1800 feet before the vein is reached. A crosscut will be run at the 1500-foot level. The hoist is a duplicate of the Homestake and Anaconda mines, and is without doubt the finest hoist on the lode.

The Alma, J. E. Francis superintendent, is to the south of the Argonaut. The shaft is down 1000 feet, with a crosscut run east 100 feet to the Kennedy vein, which is here 35 feet wide. A crosscut 735 feet east from the shaft to locate the Muldoon or Amelia vein failed to locate it. Levels are now being run on the 950-foot level.

The Anita, P. Reichling superintendent, is south of the Alma and directly west of the Zeila. The shaft is now down 500 feet, with crosscut of 75 feet to the vein, and drifts run north and south 700 feet to the ore bodies. Mr. Reichling is one of the oldest superintendents on the lode. Having found a good mine in the Kennedy, in the past, he has come back to the old location to seek another Kennedy in the Anita.

The Zeila, W. F. Deitert superintendent, is now down 1000 feet, with a vein of from 25 to 30 feet, and forty stamps are dropping. The vein matter is heavily sulphureted. The mine has its own chlorination plant of five tons capacity. Other superintendents hint at the large values of their ores, but Mr. Deitert boasts that the Zeila never was a $5 proposition, nor a $4; and yet, under the excellent management of the superintendent, the mine has been a steady dividend payer ever since it was placed under his management, and shows what can be done with mother lode ores of low value when worked to a depth of 1000 feet with a Deitert in charge. The Zeila Company have shown their appreciation of their superintendent by erecting the handsomest, most convenient and extensive office on the lode.

The Amador Reduction Works, Voorhies & Barney proprietors, located at Amador City, with a branch at Drytown, affords the mines of the county an opportunity to have their sulphurets worked at home at a reasonable price by people who have the confidence of every miner in the county.

Knight's Iron Works at Sutter Creek are conveniently located and are a convenience and saving to all the mines in the county. Mr. Knight has just placed one of his water governors on the Baliol mine at Sutter Creek, and has also equipped the large electric plant at Ogden with one of the same pattern.

To the east of Jackson, near Volcano, lies the Monte Cristo mine, J. S. McCall superintendent. This is an immense mineralized dyke, decomposed and easily milled. The mine is developed by a crosscut tunnel which places a body of ore estimated at 1,000,000 tons in sight. The vein is 60 to 200 feet in width, carries an average value of $2, and is mined and milled at an average cost of 60 cents a ton. The ore at present is crushed in a 6-foot Huntington. E. H. SCHAEFFLE.

Murphys, Cal., Nov. 20, '97.

Butte.

At Forbestown the upraise in the Gold Bank mine from the 1600-foot tunnel has reached the upper works. This upraise is said to be the longest of the kind in the world.

The Butte County Miners' Association has reorganized at Oroville, W. E. Duncan, Sr., Pres., S. S. Boynton, Sec.

Calaveras.

From Jan. 1st to Nov 1st, '97, 564 mining locations were made and recorded in Calaveras county.

It is understood the filing of articles of incorporation of the Utica Mining Company does not mean any change in the ownership of the Utica mine at Angels. The act of incorporation was decided on by the original owners of the property to easier handle their interests and to provide for the perpetuation of the concern on the original lines in the event of the death of any one of the owners. The incorporators named in the articles filed are now connected with the management of the property. Mr. Shinn, one of the directors, is C. D. Lane's attorney in fact, and another director is T. T. Lane, the superintendent of the mine and the son of Charles Lane. The mine is still owned by Col. Hayward, the Hobart Estate Company and C. D. Lane.

Los Angeles.

R. E. Nickel says the Red Rover mine at Acton is locally reported to be taking out $3000 in gold daily. The company owning the mine is arranging to develop electricity on the Big creek.

James S. Crawford et al., on July 21, 1877, located the Kentuck petroleum mine, in the Los Angeles land district. Entry was made January 23, 1892. Part of the patent was in conflict with the Southern Pacific Railway Company, and this company filed a protest, claiming that petroleum lands are not mineral lands. The protest of the company was dismissed, and its selection held for cancellation. The Secretary of the Interior recently decided that the entry of the mineral claimant may be passed to patent.

O. S. and William Bookhout, January 2, 1892, located land in the Los Angeles district as "the Bookhout placer oil claim," under the mineral land laws. January 27, 1893, the State of California filed its application to select this land as indemnity for lost school lands. The Secretary of the Interior has rejected the application of the State.

Secretary Bliss has rendered a decision in the case of the motion for review of departmental decision of August 27, 1896, filed by the Union Oil Company. On January 16, 1894, this company made mineral entry covering seventy-nine acres of land in the Los Angeles land district, known as the Central oil mine. A portion of it had been selected by the Southern Pacific Railway in 1887 as indemnity under its grant of March 3, 1871. The railroad company was allowed sixty days to show cause why its selection should not be cancelled, and the mineral claimant was required to show a discovery of a valuable mineral deposit for each twenty-acre tract or fraction thereof. From this action the mineral claimant appealed. The railroad company, in answer to the rule upon it, alleged that lands containing petroleum are not mineral lands. In conclusion, Secretary Bliss says:

"The decision under review is hereby vacated. The mineral entry in question will be allowed to stand, and if satisfactory in other respects, may be passed to patent."

Mono.

Bodie is the only $4 camp in the State. At present about 250 men are working for wages, at a *per diem* of $4. Bodie is on a cash basis. Farmers receive spot coin for every article they deliver and sell.

J. S. Cane has purchased the Noon Day mine, and in the future will furnish tailings for his cyanide plant.

The principal mines of Bodie are: The Standard, Syndicate and the Bodie Tunnel. Within a radius of twenty miles are Lundy, Copper Mountain, Dunderberg and Ward Shaft, all of which are working full forces, and as far as the public knows, the ore produced is good.

Sup't Kermeen of the Dunderberg has closed the cyanide works for the present. At and around this mine there are thirty-five men working. The ledge is from 11 to 12 feet wide, and a shaft is going to be sunk from the tunnel. The Dunderberg is operated by an English company from the Isle of Man. Six men are working in the Ward shaft.

Bodie *Times-Index*: Utah's pumice stone deposits are now supplying over 60 per cent of that article in this country, and with a tariff of $6 per ton the peoned product of foreign rivals is practically shut out. We have vast quantities of pumice in Mono county, between here and Mammoth, particularly around Mono lake, in which vicinity there are enormous quantities of it, but cost of transportation "knocks the sand out of it," so far as profit is concerned. But we may yet have a railroad to tide water.

Nevada.

Supt. Simmonds at the W. Y. O. D. mine, Grass Valley, has put in electric power. The 40 H. P. motor runs the 20-stamp mill rock breaker and eight concentrators. The mill has 850-pound stamps, dropping ninety-five times per minute. Recently a new chute of ore was struck in the 900 level. About sixty men are employed.

The tunnel of the Red Dog drift mine at You Bet is in 400 feet from the foot of the incline. The owners of this claim have already spent $12,000 in opening the property.

Union: The St. Gothard Mining Company have gone to work on the Delhi mine, recently purchased by them from Robert McMurray and others. Seven men are employed at present, with A. S. Bigelow of Columbia Hill in charge.

Transcript: At the Bellefontaine mine the ledge has finally been struck at a point 55 feet from the incline and 100 feet below the main tunnel. The ledge there is 2½ feet thick.

Herald: At the Providence mine the new hoisting rig is on the bottom level (1780 feet), in the south drift, 350 feet from the main shaft. Here another shaft was started, down now about 100 feet. It is the company's intention to sink 1000 feet. The shaft is on the Providence Company's front ledge, about 7 feet thick at this point, with walls of granite. The ore is rich.

A good body of ore is reported in the Maryland mine.

Transcript: The Bismark and the Gladstone quartz mines on Selby Flat two miles from Nevada City, have been sold by Sidney Smith of San Francisco to a New York company who will erect machinery and develop the property.

Placer.

The Pioneer mine earned $9337 gross for October, and $3058 net. The amount of rock crushed was 508 tons, and the average yield was $18.38 per ton. The lack of water hampered the working of the mill to its full extent, but advices from the mine received recently state that there are four inches of snow on the ground. The October output compares with previous months thus:

	Oct.	*Sept.*	*Aug*
Tons rock crushed	508	610	765
Val. gold bars	$9,337	$11,858	$14,543
Payroll	4,636	4,441	4,367
Bills	1,642	1,271	1,723
Total ex	$6,278	$5,712	$6,090
Net earnings	3,058	6,146	8,453
Av. value rock	18.38	19.44	19.01
Men employed	57	56	53

Sentinel: The Bear River Hydraulic Company has turned in 200 inches of water and started their hydraulic elevator in Bear river, near Colfax. The plant is in successful operation.

Plumas.

J. H. Challen, Supt. Topaz-Centennial, has two shifts of miners driving a bedrock tunnel to open up the gravel channel. Two hundred feet of the contract has been completed. The same distance is yet to be run.

Angus Cameron in his drift mine on the North Fork this season has taken out an average of an ounce a day to each man employed in the mine.

National-Bulletin: At Granite Basin many of the miners have suspended work till next spring. See & Jolly continue to extract ore from their mine and crush it in their 5-stamp mill. The Benjamim mine has closed down for the winter, but in the spring work will be resumed.

The Chicago Company, a few weeks ago, released their hold on the Robinson mine, on which they had been prosecuting development work. By maintaining an expensive crops of officials and by mismanagement, they failed to make success of the proposition, though the ore was of good quality, a fact demonstrated by six of the men who, after the company quit work, in eight days mined and milled ore from which they obtained $300. The shaft is down over 100 feet and the ore body is good, yielding from $8 to $12 per ton, free milling. Five per cent of the ore is sulphurets worth $100 a ton. The pay chute is 200 feet long, and it bears strong evidence of going down to great depth.

Riverside.

The Perris district, as soon as the Gavilan is finished, will contain eighty stamps.

San Diego.

At the Contact mine the work consists of three tunnels, 28, 39 and 110 feet, and a 10-foot shaft. A ledge from 3 to 7 feet in width has been struck, of which an average assay shows the value of $20 per ton, free milling. Fuel and water are reported plenty.

L. N. Bailey, owner of the Kentuck S. mine, has interested a New York company in his mine and will drive a crosscut tunnel to tap the ledge at a vertical depth of 320 feet.

Shasta.

(Special Correspondence).—The Iron Mountain property comprises about 200 acres of mining ground. The compressor is operated by steam, working six drills. Work is carried on in three levels, the lowest of these being 800 feet below the surface. A narrow-gauge steam railway circles down the mountain a distance of thirteen miles to the smelter. An average of five trains daily of ten to seventeen cars is used for transporting the ore. The elevation is about 2000 feet higher than Keswick. The company employs 400 men. Mr. F. B. Willson is superintendent. The property is owned by the Mountain Copper Co., Limited, of England. Matte from the smelters goes direct from Keswick to Galveston, Texas, by rail. It is shipped then by sea to Newport News, Virginia, where it is transferred to vessels that land it at the refineries at Elizabethtown, N. J. It takes about three weeks.

Sierra.

Sup't Wingate of the Thistle Shaft mine, is expected to arrive this week from Scotland, when it will be known what is to be done in regard to resuming work on that mine.

Last week gravel was struck once more in the South Fork mine, near Forest City, the bedrock having pitched 30 feet in a short distance.

The *Enterprise* reports good progress being made with the new mill being built at Sierra Buttes.

Wm. York at the Rising Sun mine near Downieville while tunneling last week struck a rich ledge. The *Messenger* says: "One piece of rock taken out contained forty-nine ounces of gold."

Siskiyou.

Yreka *Journal*: The Blue Gravel mine at Greenhorn will be started up again as soon as sufficient water can be secured.

The Distlehorst & Barton dredger has moved down the Klamath a little further, having worked out the gravel where they have been stationed for several months past. They are now again on good pay dirt.

At the Minetta B mine men are putting in a new elevator and rigging up for the winter work.

A Scott Valley paper says there will be a

great deal of development work done on the various quartz mines on upper Humbug next season. It reports a deposit of copper ore near the head of Dutch creek "running from 10 to 20 per cent in copper, $100 per ton in gold."

The *Journal* reports the river miners on the Klamath still hoisting pay gravel in spite of the late storms, and doing well in taking out an abundance of gold dust. The rain has raised the river a few inches, to make heavier current for the wheels, as the stream was lower this year than for many years, causing much trouble in keeping the wheels turning at some points with sufficient force.

Trinity.

Pres. and Manager Allenberg of the Altoona quicksilver mine at Cinnabar, says that after eight months' idleness on account of water in the mine work will soon be resumed. Two fine ore bodies have been discovered.

Tuolumne.

The Santa Ysabel Gold Mining Company has ten stamps at work.

In the Rawhide, the main shaft is 1300 feet deep. About 100 men are employed. In the App the main shaft is now over 1000 feet deep; seventy men are employed.

NEVADA.

A shaft has been sunk 185 feet, 200 feet of crosscuts and 500 feet of drifts run and a 10-stamp mill keep running since its construction on ores extracted from the Berlin mine, Ione, Jos. Bray, superintendent.

Times have changed in the old Silver State. At Stateline, the Stateline G. M. Co., A. Popkiss manager, the company is paying twenty cents per hour for laborers and $2.85 a day for miners.

The Wells *Herald* says the Salmon Mining and Smelting Company at Contact is preparing to resume. The smelter will be remodeled and ready for business by the first of the year.

The Gold Creek, Elko County, Mining Company stockholders are dissatisfied with the management of J. L. Robertson and F. Hopkins, a Wall street manipulator, has been elected president in his place.

H. H. Blood, sup't of the leaching plant in Sixmile canyon, near Dayton, says that one-half the plant is completed and ready to operate, but it is doubtful if it will be started up this winter, as the cold weather would freeze the water pipes and cause considerable damage. The plant as now completed is capable of handling 150 tons of material per day. In the spring it will be enlarged so as to handle 300 tons per day.

The Kingman *Miner* thinks that as a result of Supt. Gracey's Eastern visit and conference with the owners the company will build a 100-stamp mill at Eldorado Canyon, Lincoln county.

Virginia *Enterprise*: Tuesday, while workmen at the Harris, Blood & Co. plant were working along on the bedrock under the tailings, they uncovered a lump of nearly solid amalgam weighing about 100 pounds. This amalgam, although mixed with black clay, contained a sufficient quantity of gold to give it a rich yellow color, and was soft, being largely quicksilver. The lump was considered to be worth several thousand dollars.

OREGON.

The Ollie Woodman group of mines, Sparta district, Baker county, are reported sold to Portland men for $5000.

The White Bird mine is bonded for six months for $10,000.

W. P. Keady, manager East Eagle Mining Company, is at the company's mines in the eastern part of Union county and making arrangements for resuming work.

J. S. Wallace, sup't Rachel mine, tells the Baker City *Democrat* that he will have water supply for milling purposes.

The Junction Bar Placer M. Co. has incorporated at Walla Walla, Wash., to operate the Junction Bar placer mine in Grant county; capital stock, $60,000.

WASHINGTON.

Work on the Big Four at Silverton has suspended for the winter. The owners, the Livingstone-Andrews Mining Company, will begin shipping in the spring.

Commissioner Binger Hermann, of the General Land Office, has recently addressed a letter to Representative Lewis of Washington, replying to some questions of the latter relative to the rights of mineral claimants to land in the north half of the Colville Indian reservation. Representative Lewis desired to know, on behalf of some constituents who had written him, whether mineral claimants on the said reservation can cut timber from their claims, and whether a patent to a mining claim on the reservation conveys the ground absolutely to the entire exclusion of the Indians.

"The act of February 26, 1896," says the commissioner, "provides that the mineral land laws of the United States be and are hereby extended so as to apply to all lands within the north half of the Colville reservation.

"Owners of valid mining locations are permitted to take timber from their claims for actual mining purposes. This authority was given by an act of June 3, 1878, and the provisions of this act were extended to all public land States by an act passed August 4, 1892.

"A mineral patent conveys not only the right to the use of the surface and to extract the minerals, but also a fee simple title in the land described."

BRITISH COLUMBIA.

H. S. Jones is sup't Waverley mine, in in Albert canyon, twenty-one miles east of Revelstoke. During the summer he had 170 men at work; they built a road twenty-seven miles in length connecting the mine with the railway. Over this road the Waverley ore will be transported. At present there are fifty men at work on the Waverley and they are getting out ore rapidly. It is the intention to ship 1000 tons of ore to Swansea.

C. Innes, manager Fern mine, on Morning mountain, near the headwaters of Hall creek, furnishes the following report of a 38 days' run to November 13th: Bullion shipped, $11,325; bullion on hand, $870; concentrates shipped, 20 tons; net smelter returns, $1500; six tons of concentrates on hand, $450; total product of the mill, $13,945; ore shipped, 20 tons; net returns, $1200; making a total of the mine and mill for the 38 days of $15,145. The total number of tons milled was 965, or an average of 25.4 tons per day. The segregation of values recovered is as follows: The first five days 30 tons per day, making 150 tons at $8 per ton, $1200; succeeding ten days, 25 tons per day, 250 tons at $9 per ton, $2250; the next ten days, 24 tons per day, 240 tons at $14 per ton, $3360; the next thirteen days, 25 tons per day, 325 tons at $21.95, $7135. The average duty per stamp in twenty-four hours was 2.54 tons. The average free gold per ton milled was $12.43. The average value of concentrates per ton milled was $2.02. The estimated cost of mining and milling per ton was $4.50. At the latter figure the total cost of mining and milling for the 38 days amounted to $4342.50, leaving a balance to the credit of the mine of $10,803.50.

Concerning the cost of mining in the Trail Creek district at a Red mountain property that is being developed entirely by hand, five men are employed, including the foreman, working two ten-hour shifts. The nature of the work in hand is a crosscut tunnel, driven through a very hard syenite formation. The tunnel itself is 4½x6½ feet in size, and is now in over 250 feet. Working by hand under the above circumstances, the tunnel is being driven at the rate of 42 feet per month, or 17 inches per day. The average cost for this development is $15 per foot, which comprises $13.50 for labor and superintendence, and $1.50 for explosives. At a fully developed mine on Red mountain, which is being worked with power furnished by its own compressor, the cost of sinking a double-compartment shaft, including breaking, timbering, explosives and lights, exclusive of hoisting, is set at $50 per foot. The estimated speed, including stations, is set at 1 foot per day. The item of hoisting is not included in this case, as the engineer, besides attending to the hoisting plant, also looks after several other departments. In this property the cost of tunneling is set at $12 per foot, including all expenses of drilling, tramming, explosives and lights. The item remains about the same whether or not operations are being carried on in the country rock or along the vein. The cost of breaking and delivering ore is set at $2.50 per ton. This includes drilling, lights, tramming, sorting, timbering and delivering on the cars, direct, without the use of teams.

At Rossland the British American Corporation has bought the Great Western for 10 cents per share, or $100,000; $25,000 down, balance January 1st, '98.

The concentrator at Pilot Bay has been running a month, employing about 200 men. Concentrating work will possibly continue before the smelter is blown in, the object being to have enough concentrated ore on hand to insure a steady run.

The *Spokesman-Review* says there no longer seems to be any question that the Josie Mining Company's officers have entered into negotiations and have practically closed a deal whereby the controlling interest in the Josie mine at Rossland will pass into the hands of the British American syndicate, of which Governor Mackintosh is the managing director. The price is 30 cents per share.

THE KLONDIKE.

At Dawson men to locate claims are in demand, and are paid from $1,000 to $1,500 for such services.

The Metropolitan Mining Expedition, a company composed entirely of Siberians, has been organized in San Francisco to explore the Yukon region. The younger members of the company were born and raised in Siberia, the others have spent the greater part of their lives in that region, and the rigors of the Arctic winter have no terrors for them. They will leave San Francisco about January 15, '98, claiming that it is much easier and safer to travel in winter through that region on sleds, when the whole country is covered with snow and ice, than at any other time of the year. They will take a supply of provisions and enough tools and implements to last them one year. From this city they will go to Dyea thence overland to the Yukon country by means of sleds. Prospecting is to begin as soon as they strike the headwaters of the Yukon, and will continue along its banks and its tributaries. The originator of the expedition says: "We are all familiar with placer mining and gold-washing. The climate and temperature of Siberia differ little from that of Alaska. We do not fear cold, and can travel, camp or work in snow and ice all winter. Our methods of washing gold in Siberia in mid-winter may appear novel to American miners, but we are obliged to resort to them because the winters are so long, and we cannot afford to be idle. In taking gravel, we make a large hole in the ground, deep and wide, like a cistern. The walls and bottom are lined with rocks, clay or cement. In winter the opening is packed with snow, which is melted by hot stones and rocks. We have to keep up a continuous fire to thaw the frozen ground before digging it."

The Chilkoot Railroad & Transportation Co. is building a railroad and aerial tramway from Dyea over Chilkoot pass to Lake Linderman. The railroad will be completed by the middle of December, and the whole line, including the aerial tramway, in operation by Jan. 15th. It will have a capacity of carrying the outfits of 400 men daily. This is expected to insure getting provisions to Dawson City not later than March 1st and to preclude the possibility of a famine in Dawson. The company has completed its telephone line from Dyea to Sheep Camp.

UTAH.

W. B. Devereux describes in the Salt Lake *Tribune* a method of blowing in a lead furnace, which, he says, starts the furnace in good condition, and with ordinary care gives very little trouble. The crucible is heated with cord wood, and as soon as the walls are fairly hot, a 2-inch pipe bent at an angle is inserted through the breast to the bottom of the wood fire and the air is blown in. The crucible is filled with cord wood and, as soon as it is blazing well, several bars of bullion are shoved in on a plank and tipped off on the wood. This bullion melts and runs down through the hot fire to the bottom, becoming red-hot. This process is continued until the crucible is full of lead, when the fire is raked out and the lead thoroughly stirred up from the bottom and skimmed. The crucible and siphon are then full of red-hot lead perfectly clean. Brands and wood are then put back on the lead to form a support for the coke and to kindle it; the breast is put in and the furnace filled with coke to about 18 inches above the tuyeres; then light slag charges and coke to the top of the jackets; then charges part ore and slag, and finally normal ore charges to the top.

A light blast is turned on until the slag begins to show at the slag taps and it can then be raised gradually to normal pressure. In this way the fusion zone is kept from rising and the furnace starts off with cool walls and a cool top. If lead makes too slowly and shows a tendency too cool in the well, a few bars can be dipped out and charged into the furnace again.

H. A. Gebhardt, sec'y Phœnix Mining Company of Bingham, reports that during the past six months the mine has produced 680,421 pounds of lead, 8047 fine ounces of silver and 65 fine ounces of gold.

A Mercur paper says: "The Chloride Point made a car shipment of ore this week which averaged 198 ounces in silver. A fact worthy of remark is that this mine, which thus far produces silver almost exclusively, has shipped and marketed since the 1st of October, '96, $20,000 worth of ore, with a force of thirteen men. This will pay for the mill, operating expenses and leave a balance in the treasury."

Mercur *Mercury*: The Gladstone shaft is producing 60,000 gallons of water every twenty-four hours and the flow seems to be increasing. Col. Wall is doing a large amount of surface work on the Glencoe group, but when winter sets in this will be discontinued and the development of the ore body recently discovered in the ground will be undertaken. The Golden Gate mill structure is going up steadily and the tanks also are being put together. The machinery for machine shops has been ordered, so that all repairs to the immense plant can be made right on the ground.

IDAHO.

The Sonora Mining and Milling Company of Wallace has incorporated; capital stock $1,000,000.

H. Glidden, from Florence, has nineteen pounds of gold, product of the sixteen days' run of the mill on the Banner mine; $14.50 per ounce: $3300. Mr. Glidden is manager for the Banner and Goldbug Companies, operating that camp.

The Upper Boise Hydraulic Mining Company, West Virginia, F. R. Reed agent in Boise, capital stock $5,000,000, is starting a new hydraulic enterprise on Boise river, on the opposite side of the river from the Twin Springs Company's works.

MONTANA.

This paper recently had illustrated descriptions of the dredges operating in Grasshopper creek at Bannack. Three dredges have been in operation, conducted by the Gilman & Barry Company, the Graeter Company and the Chicago Gold Dredging Company. Further reports from there are to the effect that the richest yield of this season was cleaned up by the Graeter dredge—$7000 in a run of twenty-four hours. The Chicago Company gathered in $4000 in one day of twenty-four hours, and the Gilman & Barry Company cleaned up 125 ounces in a similar run, equal to $2500. A fair average of the work of the companies for the season may be estimated at $10,000 per week. The dredges handle about 100 cubic yards of dirt per hour, and worked constantly until the stream froze.

Of the Golden Scepter at Quigley J. M. Burkhart says: "By the recent sale which has been confirmed by the court the whole property, including the mine, mill and partly built tramway from the mine to the town where the mill is located, passes into the hands of the new company, and with good conservative management and plenty of working capital the plant will soon be a producer and dividends will be paid from the start, as soon as the plant is fairly in operation. There is ore enough in sight to run the mill at its full capacity for fifty years. The ore is low grade and will average not more than $4.50 per ton."

The State of Montana, with a population of 180,000, produced $62,000,000 of wealth in 1896, and since 1890 every smelter in the State has doubled its capacity, with one exception.

At Norris the 10-stamp mill recently erected by the Montana Boy Consolidated Mining Co., which has been operating for the past four months on the Bradley group of mines, is closed down. It is locally claimed that while the ore carries gold in paying quantities, the mill is not making a good saving by the process in use.

COLORADO.

H. J. Stephens of Denver has sold the First Centennial gold mining property, at Black Hawk, to W. P. Bonbright & Co., for $127,500.

The Georgetown *Courier* of the 20th inst. says: "The Beam process mill at Empire proved a failure. The furnaces are being torn out and some other process will be tried.

An El Dora dispatch reports a strike in the Enterprise. A streak of bar sylvanite on the hanging wall at a depth of 85 feet is in lime rock, and the full length of the shaft.

The owner of the Lamartine mine, near Idaho Springs, says that in the future the mine would be worked for the production of gold and lead, and that the silver production would be a by-product. The silver leads will not be worked, but those which produce both metals will continue operation. There will be no development of the silver leads, but the gold-bearing ones will receive greater attention than in the past. Employment is given to about sixty-five men.

Philip Argall of the Florence Cyanide works explains to the Victor *Record* the recent action of the smelters: "The mills and smelters have been paying too much, and have just come to the conclusion that it is poor business policy to pay $20 for gold when they receive but $18. I don't believe that Cripple Creek gold will average over $18. None of the mills are making any money at the present schedule. There are two mills, one on each side of Florence, that are now idle simply because it does not pay to operate them. The mill men simply want to make a little money for a change."

To the question: If there is no money in the business as it has been conducted, why do people keep building new mills and enlarging the old ones? Mr. Argall answers: "They don't know any better in the first instance, and in the second they have so much capital invested that they must put in more or lose what they already have."

An Aspen dispatch of the 24th says the Smuggler mine fire is out, and the work of clearing the workings preparatory to breaking ore begun.

For '97 to date Colorado claims to have mined in gold $22,000,000. Denver places the value of the silver production at $12,300,000, lead $3,000,000, copper $1,500,000, and iron $3,000,000.

Telluride *Journal*: E. I. Field, resident manager of the North American Exploration Company, has control of ten more stamps of the Telluride Power Transmission Company's 120-stamp mill, in Bear Creek. In a week or ten days they will also be dropping on Nellie ore. Thirty stamps of the big mill have been stamping Nellie product for several months past, but so much mineral has been encountered in the mine recently that additional milling facilities had to be called into requisition in order to get it out of the way and make room for development.

NEW MEXICO.

In Grant county, at the Texas mine, Centra district, the shaft is 320 feet deep. A new hoist is badly needed.

At the Hanover mine, Silver City, for several months past the mine has produced thirty to forty tons per day of low-grade copper ore. About two weeks ago a large deposit of high-grade ore was encountered: native copper in a soft matrix.

At Mogollon the Confidence has seventy men at work. About sixty tons of ore per day is reduced at the company's mill at Whitewater. About fifty men are employed on the water-pipe line, trestle, riveting pipe and other work, utilizing the water power of Whitewater creek.

At Cooks the Kansas City Smelting & Refining Co. of El Paso is working the Othello and Desdemona mines and shipping twenty tons of lead ore per day.

ARIZONA.

At Graham the Detroit Copper Company closed down their works November 1st. New machinery will be put in place and the plant improved and enlarged.

The Milwaukee and Arizona Prospecting and Mining Company has incorporated. It is a Wisconsin incorporation. Capital stock $1,000,000. C. F. Schilling, Riverside, Pinal county, is resident agent.

A mill is being constructed at the C. O. D. mine, Mohave county. During October the Kingman sampler sold to the El Paso smelter over $28,000 worth of ore—product of Mohave county chloriders. The Model mine, in Weaver district, Yavapai county, is being worked under lease by C. Ryan. The ore runs $75 in gold per ton. A low-grade deposit is being developed by A. L. and G. McKesson, east of White Hills. The vein is 25 feet in width and goes $10 to the ton. White Picacho district, in Yavapai county, numbers several good mines, among them being one owned by G. Burnell, on which 30 inches of $280 rock has been struck at a depth of 110 feet. The vein at this point was reached by a 75-foot tunnel.

A twenty-five ton chlorination plant will be purchased for the Providence mine, in Yavapai county, on the recommendation of Prof. Saunders. The Copper Queen Company, operating at Nacosari, Cochise county, is building a narrow-gauge railroad, four miles in length, from the mine to the smelter site. The road will run directly under the mine, necessitating 5000 feet of tunneling, and chutes will conduct the ore to the cars.

A proposition for a smelter in Prescott, as submitted by B. F. Prichard, representing the Pacific S. & M. Co. of Los Angeles, Cal., is as follows: The Pacific S. & M. Co. will put in a copper bullion, matte and lead bullion plant with a capacity for each of the two smelters of forty-five to sixty tons for twenty-four hours in free smelting ores, the boiler to be 20 to 25 H. P., the engine 20 H. P., the main building to be 20x50 feet, two stories; the engine room 20x20 feet, one story; the plant to be supplied with bins for coke and ore and all other accessories necessary to operate successfully. The company agrees to sell such a plant outright to the citizens of Prescott for $15,000, taking as part payment $3000 in the stock of the company organized and incorporated for said purchase, with the proviso that B. F. Prichard be retained as manager at $200 a month.

The second proposition was that, for a bonus of $5000, the Pacific S. & M. Co. would bring the above-described plant to Prescott and operate it upon their own responsibility—$3000 to be paid on arrival of the plant and $2000 when completed.

Prescott people prefer the latter proposi-

Electrical Progress.

The Newest Great Power Project.

Written for the MINING AND SCIENTIFIC PRESS by ORRIN E. DUNLAP.

The St. Lawrence Power Company is making good progress on their project for the development of power at Massena, St. Lawrence county, in New York State. At Long Sault rapids the St. Lawrence river has a fall of over 50 feet, and to the south of these rapids there extends a comparatively level plateau of about three miles, where it meets the valley of the Grass river, the water in which, at this point, is all of 45 feet below that of the St. Lawrence above the rapids. The volume of water passing through the Grass river is small, and it enters the St. Lawrence below the rapids. A canal is now in process of construction, designed to carry the waters of the St. Lawrence from a point above the rapids across the plateau above referred to to the valley of the Grass river, where it will be delivered upon turbines at a head of about 40 feet. After passing through and actuating the turbines, this water will return to the St. Lawrence below the rapids. Thus the head race of this power project will be the St. Lawrence river and the three miles of canal, while the tail race will be the Grass river.

The point of operation presents a busy scene, and work on the canal is well under way. In width the canal will be about 225 feet, and its depth about 25 feet. It runs is a northerly straight line from the St. Lawrence to the Grass river. The amount of material to be excavated will, of course, be very great, but it will be all earth, but little rock being encountered. The head of the canal on the St. Lawrence will be just below a promontory, which will serve to deflect the ice and drift of the river to the opposite shore. Where the canal will enter the Grass river the banks of the later are about 40 feet high.

The Lehigh Construction Company of South Bethlehem, Pa., have the contracts for the construction of the canal and power house, and they are pushing the work with great vigor. The dirt conveyor that is being used on the work is of a new design, modeled after the plans of John Rice, who is the engineer of the Lehigh Construction Company. From an engineering point of view it is most interesting, as it is quite unlike anything used on such contracts before. In appearance it resembles a huge derrick, its length being 230 feet and its height 60 feet. It is operated on trucks, which run on a temporary railroad laid on the bed of the canal. Buckets attached to an endless chain traverse the entire length of the machine. Four steam shovels will be used to loosen the earth, which will be taken up in the buckets and carried to the far end of the conveyor, where it will be dumped well outside the line of the canal.

The power house will be 130 feet wide and from 500 to 600 feet long. It will stand on the rock bed of the Grass river, which will be excavated deep enough to allow of the free passage of all the water from the turbines. The arrangement of the apparatus in this power station will be somewhat novel, inasmuch as the turbines will be vertical mounted on horizontal shafts, and four of them will be necessary to operate each of the 5000 H. P. generators. The generators will number fifteen, and they will be mounted on the same shafts as the turbines, but 80 feet distant from them. The generators are to be made by the Westinghouse Electric and Manufacturing Company, and of them Mr. B. F. Warren, vice-president of the Westinghouse Company, says:

"The machines for the St. Lawrence Power Company are not only of large sizes, but they involve a new design and are in many ways different from other machines. Each of these great machines will weigh about 350,000 pounds, the weight of one piece being as much as 125,000 pounds. They will stand 22 feet high above the top of the foundations, and each machine will occupy a floor space 22x18 feet. They will have horizontal shafts, which will be in line and directly connected with the shafts of the water wheels by which they will be driven. The shaft of a dynamo carries a great steel ring which is very similar to a large and heavy flywheel. This steel ring carries at its circumference twenty external projecting pole pieces. The ring and the pole pieces are one solid casting of steel. The ring has an extreme diameter of 15 feet and it is about 3 feet wide. It is supported from the shaft by a massive cast iron hub, with ten radial arms or spokes. The steel for the rings is designed for very great strength. It revolves at a speed of nearly two miles a minute, and the centrifugal force is such that each pound at the circumference tends to fly outward with a force of nearly 100 pounds. The speed of the machines is 180 revolutions per minute.

"This great steel ring with the projecting poles revolves inside of a large stationary ring or cylinder, whose inner surface is made of plates of thin, soft steel on edge. These thin steel plates are held by a massive outer ring of cast iron, which has a total height of 22 feet. The thin steel plates which form the inside of the stationary part have slots in which are laid copper bars parallel with the shaft of the machine. These bars are insulated with mica, and in them are generated the currents which the machine produces. These currents are produced by the revolutions of the poles or projections on the revolving inner steel ring. Around each of these projections there is a coil or copper strap, of which each turn is insulated from other turns and from the steel pole by mica. A current is sent through the coils on these polar projections, which strongly magnetizes the poles. The revolutions of these magnetic poles in front of the copper bars in the outer part of the machine induces currents in them. These currents are alternating currents which are continually reversing in direction at the rate of 3600 times per minute. Three conductors are carried from the machines, which are wound for giving three phases. The currents in the different conductors do not occur at the same time, but have their maximum values in regular succession."

The St. Lawrence Power Company was organized under the laws of New York State, with a capital stock of $6,000,000. The officers of the company are: President, Walter C. Lane; vice-president, S. H. G. Stewart; secretary, Carlton H. Reeve; treasurer, William C. Cox.

It is expected that the power house will be supplying current by December 1, 1898. Lord Kelvin, the famous English electrician and scientist, visited the site of the work on October 2, and was well pleased with the project.

IN Santa Ana, Cal., canyon the Southern California Power Company is spending $150,000. The waters of the Santa Ana will be diverted at the junction of Bear creek by a small dam into tunnels and flumes, having a carrying capacity of 11,000 inches, and conveyed three miles down the canyon to Keller creek, where the power house will be located. Of this distance half will be tunnels through the hills and half flumes. There are eighteen tunnels, some of which are already through and ready to be cemented or bricked, as the formation of the hills through which they pass may demand. The power house will be built of concrete and iron. The dimensions are 130x40, the walls 2 feet thick. The six machines, any one of which can be operated alone, will generate 22,000 H. P., which the transformers will increase to 33,000 volts. The receivers will be 30 inches of steel. The water wheels into which the water will be sent at a pressure of over 300 pounds will be 82 inches in diameter, six large ones and three smaller ones. For the head used this plant will have, it is claimed, a greater volume of water than any plant now in existence. The line from the power house to Los Angeles will be eighty miles long, thirty tons of wire and over 4000 poles being used in its construction. The insulators, which will number 144,000, will be tested and none that will not stand a voltage of 66,000 volts will be put up. About a third of them have already been tested at Colton. The poles and wire are now being distributed along the line and the work of putting in the poles and stringing the wire will be begun in a short time. There will be two substations, one at Pasadena and one at Los Angeles, and most of the power will be used for lighting and running the electric cars in Los Angeles and Pasadena.

Mechanical Progress.

Great Power Wheels.

Few realize the energy which is stored in a running flywheel, commonly run at a rim speed of a mile a minute; each square foot of the rim weighing about seventy-five pounds if it were two inches thick, more in proportion if it were thicker. A single segment of a big flywheel will often weigh a ton. Imagine it flying about at the rate of 80 feet a second. It would hit as hard and do as much damage as though dropped from a height of 120 feet. While the wheel is revolving at the rate of a mile a minute there is a strain of about 750 pounds in each square inch of its section; were a piece detached and thrown off at an angle of 40° it would strike 240 feet from where it started if it encountered no resistance. This is, under normal conditions, the capability of a mass revolving at a speed which is well within the limit of sound and ordinary practice.

With increasing speeds, however, the effects increase at a rapid ratio. At two miles a minute each square inch of section is submitted to a tensile stress of 3000 pounds, a piece of the rim would be thrown into the air to a height of 480 feet, and in whatever direction it flew would have the same velocity and destructive capacity as though it had fallen from that height, and starting at 45° would strike the ground at the same level, 960 feet away.

But this is not a bursting speed. It is only twice the normal, and imposes a strain of only 3000 pounds per square inch on the section, while cast iron tests all the way from 13,000 to 30,000. Supose the weakest section had an average strength of 10,000 pounds per square inch, in order to burst from centrifugal force the wheel would have to have a rim speed of 321 feet per second, 3.6 miles a minute, and each fragment would have as much energy in it as though it had dropped 1600 feet. If one will imagine ten or fifteen tons of cast iron he will have an idea of the capability of a wheel that weight to do damage if run up to its legitimate breaking speed. A 10-ton wheel breaking at speed which will develop 10,000 pounds per square inch of rim section will set free 32,000,000 foot-pounds of energy. A 100 H. P. boiler exploding will only liberate about 80,000,000 pounds altogether. Most of this is exerted in pushing back the atmosphere and very little in putting solid bodies into motion, while the energy of the flywheel is entirely represented by flying masses of iron.

To do this the wheel is running at only 3.6 times the normal speed, *i. e.*, so far as speed is concerned it has a factor of safety of 3.6, while, considering the ultimate rim stress at 10,000, it has at a mile a minute an apparent factor of safety of over thirteen.

The device which controls and keeps within limits the speed of the flywheel is often simple to crudeness, and when it is realized what a danger attaches to loss of control, it is probable that owners and engineers will be less easily satisfied. Systems are in use in which an auxiliary governor trips a device which shuts the engine down upon an acceleration of ten per cent or so. The device can be operated by electric push buttons from all over the works, so that the engine may be quickly stopped in case of accident to the machinery or employes in any department. This may be considered unnecessarily elaborate by some power-plant owners, but any of them can afford a quick-closing valve in the steam main which can be operated by a man out of the line of flywheel. Such a simple arrangement would often save lives.

Scheme to Supersede Railroad Traffic.

J. E. Russell, member of the national deep-waterways commission, has come to the conclusion that railroads, which surperseded canals, have reached their best estate, and that in the near future canals are to be restored to the first rank. But it will not be the old canal. He sees in the development of engineering the practicable means of construction for immense channels through which ocean steamships will enter and traverse this country from end to end.

He says the days of removing rocks under water by blasting are gone by forever. Gen. Newton and his extensive works for the removal of rocks at Hell Gate are antiquated. One of the rock-dredging machines which he saw in his explorations had a grappling apparatus weighing seven tons. The operators did not blast at all, unless to make a face for the beginning of work, but put their dredger directly upon the ledge 20 feet under water and wrenched off immense masses at once, so that at times they had to be broken up before they could be deposited upon any of the conveyances for carrying away the debris. The consequence of improved invention is that the cost of removing a cubic yard of rock has been reduced in ten years not less than two-thirds. He describes work now in progress in Canada where $80,000,000 has already been spent in the St. Lawrence valley, and it is already a profitable investment. This is more than six times the expenditure of the United States in improving communication between the Great Lakes. The least depth in the Canadian line from Lake Ontario to the ocean by the St. Lawrence route will soon be 14 feet. This means that vessels of small carrying capacity can be brought across the ocean directly into the heart of the country. The saving in the cost of long-distance transportation of bulky freight over the cost by land carriage will be enormous. Railroads cannot compete with deep waterways, and there will be a revolution in the business of through transportation.

The carrying capacity of the large vessels which will be used on the canals of the future will give them an immense advantage over the freight cars. The time is not distant, he says, when canals will be constructed with a depth of 30 feet and a corresponding width. There is no doubt that large ocean vessels will be brought into the heart of the country, and that transportation will be vastly promoted and cheapened. The great drainage canal which is being built in Chicago, to his mind, will be a waterway connecting the Illinois river and Lake Michigan. With a depth of 30 feet, with sufficient width and with protected sides this will be used for the passage of vessels from the lake into the Illinois river, and that brings them into the Mississippi.

The use of water transportation from the West to southern ports has greatly affected the trunk lines of roads east and west. The creation of deep water at New Orleans and Galveston has led to shipments of grain from there, which have reduced the freights of railroads. More grain is going by steamers from the mouth of the Mississippi, and the nature of freight business in the South has been materially modified. The entire course of the Mississippi and of the Great Lakes will be connected with the St. Lawrence and with the Atlantic at New York, and will be used for ocean vessels of greatest tonnage.

The canals will have to be prepared for large vessels, and steam will be used for motive power, and much more speed will be secured than was ever possible in the old days. The banks of the canals will be riprapped so that the wash from the steamers will not destroy them, but this can be done easily

and a good freight speed can be secured across the country. Vessels will start from the ports of the Great Lakes for foreign ports.

What Invention Has Done.

What is it that enables an operative to day to produce so much more in a less number of hours than he could thirty or forty years ago? It is simply invention, as embodied in the improved machines, tools, processes and appliances that American inventors are constantly furnishing to American manufacturers.

Near Baltimore there was recently erected one of the largest plants in the world for the manufacture of Bessemer steel in all its forms; and, as recently stated by its superintendent, by means of the inventions and improved appliances they have adopted, they are enabled to produce a ton of steel with but one-third of the manual labor required at their other establishment, built twenty or twenty-five years before.

In 1866 steel rails cost $165 per ton. In 1884 they had dropped to $34, in 1893 they were $21 to $24 per ton and in 1897 even less. See how that has expedited the building of railroads, which now cover the country like a network, and without which modern enterprise could not be carried on; and the same is true of steel in all its forms. So that to-day we build steel bridges, steel vessels, steel cannon, steel frames for our buildings and for farm implements and use steel nails.

Inventions and improvements have so reduced the cost of steel rails that already, during the year 1897, the United States has sold 100,000 tons to Europe.—Engineering Magazine.

Scientific Progress.

Like Unto the "Zymean Metallurgy."

J. W. Worsly writes the London *Mining World* that when in the United States he met with many auriferous lodes cropping out to the surface, chiefly of the sulphide class, but they were not valued because the assay showed them to be under 1 oz. per ton of 2000 pounds, and this was in a State where both fuel and water were not over plentiful.

"Within the last year my attention has been called to a process (patented), the principal agent in which is S^2Cl^2, whereby all sulphide ores that contain metallic value can be both easily and cheaply treated, recovering all the metallic contents at one operation and almost at the one cost. Into an eight-ounce flask pour, say, six ounces of a 25 per cent solution of chloride of sodium, and heat to 160° Fahrenheit, adding about thirty grains of sodium nitrate. Place into the flask, say, about one ounce of the sulphide ore to be treated, so finely powdered as to pass through a 30 to 40 mesh sieve; slightly shake, so as to thoroughly mix. Now add about one teaspoonful of sulphur dichloride (S^2Cl^2), and note the effects produced. Sulphur dioxide, hydrochloric acid and chlorine will be evolved. Very gently stir, and, when quiescent, which it will be in about ten minutes, add another like quantity of S^2Cl^2 and again note effects. In about fifteen minutes a small sample may be taken out and filtered for testing with the usual re-agents for Au., Ag., Cu., Pb., Stahn., Zn., etc., when it will be seen how far the solution of these metals has been effected, and so determine whether further digestion is needed or otherwise. If satisfactory, the chemist will know how to proceed to precipitate the metallic contents after he has skimmed off the sulphur, which, by the way, can all be recovered, refined, and sold at a good price. This experiment, if well done, will give an idea of what the basis of the 'Zymean Metallurgy' is like, and it may be tried on any sulphide ore, no matter how refractory, and all the valuable metals separated.

"I have tried it on quite a number of ores with unvarying success, from one pound to as much as five cwt., and always when practice has familiarized me with the ore the treatment was as stated. With ores containing sulphide of zinc—the terror of the smelter—I find no trouble when submitted to the action of sulphur dichloride in the above-named menstruum. It is worthy of note that, after separating the metals from the salt solution, it can be used again for dissolving, being still salt water, and not sodic sulphate, as might be expected. This was a puzzle to me at first, till I found out that at an electric chemical works near by a similar thing occurred. Here salt solution was decomposed by large dynamos, worked by powerful engines, and soda and hydrochloric acid formed in one part of the vessel, to be again united before the acid could be separated and leave the decomposing tank, the result being a solution of common salt; and so it goes on, separating and uniting all the week over. The essential points in effecting a complete solution of sulphide ores by the Zymean metallurgy are: 1. Proper strength of the salt solution; 2. Temperature not too high; 3. The ore to be sufficiently fine; and, lastly, due care in adding dilute hydrochloric acid where needed by alkaline ores, and stirring well after first introduction of S^2Cl^2, which is easily and inexpensively obtained on the spot from the otherwise waste products of sulphur and hydrochloric acid gas. But nothing but practice can teach perfection of manipulation in even a most simple metallurgical operation, such as this must be acknowledged to be."

A New Illuminant.

I have the honor to report an important discovery which, it has been claimed, will in time do away with the present system of illuminating public places, etc., with the electric arc light. The details, briefly, are as follows: Mr. Ernest Salzenberg, director of the gas works of the city of Crefeld, has invented an improvement in incandescent gas burners, which relates to the production of incandescent gaslight, based upon the discovery that, when the pressure of the gas is considerably increased upon the incandescence body, the said body emits a golden-yellow light, very agreeable to the eye, displaying objects in their natural colors. The gas is supplied to the burner at a pressure of about 3½ atmospheres, the burner, to withstand this high pressure, being of special construction. A single incandescent jet of the ordinary size can emit a light of much more than 1000 candle power. The light is of such intensity that a person is enabled to read the finest print at a distance of 100 to 150 feet.

The inventor claims that the cost of his incandescent light of 1500 candle power is only 4½ cents per hour, while that of the ordinary electric light of 400 candle power is (in Germany) 14 cents per hour. In the apparatus constructed by Salzenberg a hydraulic pressure of 3.5 atmospheres, and even more, may be forced through the improved Auer burner. The invention is, however, only applicable where waterworks exist. Mr. Salzenberg has already applied for letters patent in the United States.

P. V. DEUSTER, Consul.
Crefeld, Oct. 29, '97.

New Patent Rules.

Acting Commissioner of Patents Greely has made a number of important amendments to the rules governing the practice of the Patent Office, and they have been approved by Secretary Bliss. These rules will apply to all cases filed after January 1st, all cases filed prior thereto being subject to the old rules. The new rules provide that no invention submitted is patentable if it has been described in printed publications two or more years before the filing of the application. Heretofore if a foreign patent has been taken out before an American patent the term of the latter was limited to the expiration of the foreign patent, which often resulted in the practical loss of many valuable patents by giving them a very short life. The new rules do not make the limitation, but if the period between the two patents is over seven months no American patent will be granted. One year is named as the period within which failure to prosecute will be held to constitute an abandonment of the application for a patent.

Coast Industrial Notes.

—Coast lumber dealers on the 20th inst. advanced the price $2 per M ft.

—The Santa Fe railroad is arranging to equip its passenger cars with electric lights.

—The Pacific Steam Whaling Company is putting on a regular line of steamers to Copper river and Prince William sound.

—F. H. Seymour is building the Torres & Prietas railway from Torres, Sonora, Mexico, to the mining camps of Minas Prietas and La Colorado.

—Secretary of War Alger still refuses to advertise for the San Pedro, Cal., harbor work, for which the $2,900,000 was recently appropriated.

—The orange crop of southern California last year amounted to over 7000 carloads, and for the coming season it is estimated at about 12,000 carloads.

—The Southern California Electric Supply Company has organized in Los Angeles; R. H. Ballard, D. B. Kearney, G. P. Curtis, W. L. Percy, A. C. Jewett; capital stock, $50,000; subscribed, $20,400.

—The total catch of seals in the North Pacific for the present season was 38,700, against 73,000 last year. The catch in Bering sea—that portion of the North Pacific in which the United States is interested—is 16,650 for the present season, against 29,500 last season. Of the catch in Bering sea, British vessels took 15,600, American vessels 1050.

—For Washington and Oregon hemlock timber there is no market. Five years ago cedar logs were nearly worthless. Ten years ago spruce, now the choicest lumber on the coast, was in no demand. To-day both of these timbers are subjects of much concern for fear of their exhaustion. There is one use to which hemlock ought to be put and that is for piling.

—Statistics of the foreign trade of Mexico show that, while the imports were practically the same in value in 1896-7 as in 1895-6, there was a considerable increase in the exports from $105,016,902 to $111,346,494. It is also worthy of note that, while England, France, Germany and Spain did less business with Mexico in the past year than in the year preceding, the United States both sold to and bought from Mexico more largely. The appended statement shows Mexico's imports and exports in 1896-7 in silver values:

	1896-7—	
Country.	*Imports.*	*Exports.*
United States	$22,593,860	$ 86,742,951
England	6,881,701	14,280,527
France	4,989,082	1,873,522
Germany	4,003,263	4,416,744
Spain	1,983,794	1,192,328
Total (45 countries)	42,204,095	111,346,494

Similar figures for 1895-6 are given below:

	1895-6—	
Country.	*Imports.*	*Exports.*
United States	$20,145,763	$ 79,651,695
England	7,905,016	16,467,149
France	6,099,183	2,080,802
Germany	4,303,229	2,968,792
Spain	2,174,298	813,162
Total (45 countries)	42,253,938	105,016,902

The distribution of the foreign trade of Mexico among the principal ports and border towns is a matter of some interest. Last year's trade was divided thus:

	1896-7—	
Port.	*Imports.*	*Exports.*
Tampico	$ 8,773,275	$ 29,952,441
Vera Cruz	14,036,136	22,484,633
Juarez (El Paso)	2,910,359	17,929,521
P. Dias (Eagle Pass)	4,710,415	2,888,535
Laredo	4,693,818	3,701,086
Progreso	1,463,515	8,443,130
Mazatlan	1,572,568	5,808,036
Nogales	944,312	5,776,575
Total (33 ports and cities)	42,204,095	111,346,494

Personal.

F. A. WADLEIGH, the Utah representative of the R. G. W. in San Francisco, is impressed with the probable magnitude of the Klondike travel of '98 and believes nearly 200,000 people will head that way.

W. M. IRELAN and Prof. Ogden are examining the Brunswick lode, Nevada.

EDWARD N. LINDSAY has returned from southeastern Alaska, where he has been examining quartz properties.

MAJOR W. H. HEUER, corps of engineers, has been reappointed a member of the California Debris Commission.

SUPT. FISHER succeeds Col. Ewing at the Diamond Hill mine, Townsend, Montana. Discussion continues as to how to secure power for the new 120-stamp mill.

J. R. MCDONALD of Milwaukee, Wis., is the newly appointed manager of the Golden Scepter mines at Quigley, Montana.

Book Notice.

"*Manual of Assaying; Gold, Silver, Lead and Copper:*" By W. L. Brown; seventh edition. E. H. Sargent & Co., Chicago, Ill., November, 1897. Price $2.50. The fact that a manual of assaying reaches the seventh edition is evidence of its possessing merit. The latest issue of this work, which is largely a compilation of standard authorities, is well issued, and deserving of place in an assayer's library. The book can be sent postpaid from this office on receipt of price.

Commercial Paragraphs

THE Jeanesville Ironworks Company has opened an office 1116 Seventeenth street, Denver, Colo., with A. Middlebrook as manager.

THE Baker Iron Works, Los Angeles, are sending stamp mill outfits to Miguel Latzy Hermano, Magdalena, Sonora, Mexico, via Nogales.

THE General Electric Company during the months of June, July and August received orders for 278 generators, aggregating nearly 14,000 kilowatts, for lighting purposes alone.

BUTTE COUNTY, CAL., SUPERVISORS want to buy 7500 feet of 2-inch black iron pipe and 2500 feet 4-inch black iron pipe, with fittings, to be used in Road District No 2. Bids received up to December 7, 1897.

THE Norwegian Mica Company, office Christiania, Norway, is working mines of mica in Norway. The board of directors are the professor of mineralogy at the University of Christiania, Yohan H. L. Vogt, and the civil engineer in Christiania, Henry E. Mohn, the latter being president.

A CLEVELAND, O., dispatch says that on the 21st a company including ex-Governor Flower, J. W. Hinkley, Anthony Brady and Perry Belmont of New York, purchased the entire property of Walker & Co., electrical manufacturers. Walker & Co. have extensive factories and foundries in that city, covering many acres. Abner Doble & Sons are the local agents.

Recently Declared Mining Dividends.

Gold Coin, Colo., 1 cent per share, $10,000; Nov. 25.

Mt. Rosa, Colo., 1 cent per share, $10,000; Nov. 25.

Mt. Rosa Company, Cal., 1 cent per share, $10,000; Nov. 25.

Commodore Company, Creede, Colo., 2 cents per share, $20,000, Nov. 25: for the year $120,000: a silver property.

New Idria Q. M. Co., Cal., dividend No. 8; payable Dec. 1.

Ætna Con. Q. M. Co., regular quarterly dividend, No. 12, of 10 cents; payable Dec. 10.

Hope M. Co., St. Louis, Montana, 10 cents per share; Nov. 21; a total to date of $732,252.

593,693.—TIRE TIGHTENER—Sager & Alvis, Los Angeles, Cal.
27,851.—DESIGN: EYEGLASS TEMPLE—S. G. Marshutz, Los Angeles, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

REVERSIBLE WINDOW.—Louis Proll, Charles M. Depew and Eugene W. Hawley, San Francisco, Cal. No. 593,855. Dated, Nov. 16, 1897. This invention relates to an attachment for windows by which they may be turned or reversed about pivots centrally disposed on opposite sides, thus allowing the sashes to be turned at right angles with the position of the line in which they ordinarily slide. It consists essentially of pieces fitting in the channels between the vertically slidable sashes and the parting strips, pivot pins by which the sashes are connected with the slides and turnable about the pins, grooves or channels made in the slides and the edges of the sashes in line with each other, vertically slidable strips fitting into said grooves or channels and movable by means of diagonal slots so that when the strips are moved upward or downward upon the pins which pass through these slots they may be either projected to engage the slides and sashes and lock them together or to separate the sashes from the slides so that they may be turned about their pivot pins. In conjunction with these devices are locking levers, fulcrumed upon the top of the lower sashes, having projections adapted to engage with the lower rail of the upper sash and inclined lugs upon the locking strips adapted to engage the lever and turn it to unlock the sashes when the strips are raised to disengage the sashes from the slides, and a spring by which the lever is actuated to again lock the sashes when the strips are allowed to drop and connect the slides and sashes.

Mining Summary.

(Continued from page 507.)

tion, and suggest that when the smelter is erected the subscribers to the enterprise pay $2.50 per ton for every ton of ore smelted, until the full sum of $5000 is paid.

MICHIGAN.

Ishpeming Correspondence *American Manufacturer*: Active operations have begun at the Cliff shaft, preparatory to the resumption of mining at an early date. The task of opening a large mine which has been idle several years is one of a magnitude scarcely to be understood except by those who have actually performed the work. Even before the first gallon of water is taken from the mine much work must be done—boilers, engines and pumps overhauled, buildings repaired, and work of many kinds performed. Once the pumps are started, there will be many weeks' work before the great caverns underground are drained, so that it will be well toward February 1st before the mine will be working again. The Cliff shaft is very dry, consequently an exceptionally clean mine, and its ore, foot and hanging walls are of adamantine firmness, no timber being required underground, except for guides and ladders. Even the largest stopes are untimbered, there being 60-foot chambers unsupported by a single stick. This mine with the possible exception of the Republic, is the most interesting which strangers can visit, being clean, perfectly safe and as easy of access and egress as the top floor of a city sky scraper, cages running in the vertical shafts as rapidly and safely as express elevators. Few miners who have worked in the Cliff shaft would not prefer to go back again, wages and other considerations being equal. The Cliff shaft, with its high, airy openings and vaulted chambers hewn from the living rock, with its dry, sparkling floors and underground passages winding in and out after the ore, apparently without premeditated plan, offers a striking contrast to such a mine as the Lake shaft of the Cleveland-Cliffs Company, where drifts and crosscuts are laid out at right angles with the monotonous regularity of a Western prairie town of a few years and great expectations; with muddy floors and open gutters beneath single plank walks, oozing air and water pipes overhead, and on every hand a monotonous vista of mine timbers—"square sets" mortised, tenoned and plumb-bobbed with a precision delightful to the soul of the carpenter, but stifling to the stranger who first visits the iron mine.

The 1897 ore output will fall but a trifle short of 13,000,000 gross tons for the entire Lake Superior district.

ALABAMA.

(Special Correspondence).—The production of minerals and manufactured products therefrom for Alabama during the month of September, 1897, as reported by the producers to Dr. Eugene A. Smith, State Geologist and secretary of Alabama Industrial and Scientific Society, is as follows:

Material.	*Amount.*
Coal	518,759 tons
Coke	92,969 "
Pig iron	70,703 "
Iron ore	259,566 "
Limestone for flux	34,000 "
Bauxite	837 "
Building stone	3,500 cu. ft.
Total number of employes	13,446

WM. M. BREWER.

Birmingham, Ala., Nov. 15.

AUSTRALIA.

T. A. Rickard of Colorado writes: "The condition of the mining districts is generally bad with the exception of the Kalgoorlie gold field. The mournful wail of the wildcat is the only voice raised to disturb the gloomy silence of the bush. There has been a woeful amount of reckless promotion and holes in the ground have been sold for a prince's ransom. Hence many collapses, besides others yet to come. At Kalgoorlie, however, very valuable veins of telluride ores have been discovered, and there is a likehood of this district developing into another Cripple Creek. Outside of this particular locality there is so much in evidence of rotten financiering and charlatan engineering that one wonders at times if mining be not one great insanity. It is evident even to a casual observer that the industry is not on the solid business basis which we know in Colorado."

A report from Kanowna, near Kalgoorlie, says that good placer ground was struck on October 15th, "the miners being able to pick up nuggets representing $250." The excitement in Kalgoorlie was increased October 21st by the arrival of two men who lodged sixty-five ounces of gold in the Bank of Australasia, which cleanup represented only two days' work. Many business men outfitted prospectors. On October 23rd men came in from Kanowna, bringing news that one of the miners filled two 1-pound tins with coarse yellow gold in one morning. No gold is struck nearer than 25 feet to the surface. Mining Commissioner Pilman of New South Wales has visited these fields, and is said to have declared that "they promise great yields for deep mining."

The *Record* says £1000 awaits the man who can persuade the Victorian Mines Department that he has a cheap and efficient method for ventilating the mines in that colony.

The Mount Morgan mine, in Queensland, has produced 1,631,981 ozs. of gold, valued at £6,712,186, and paid dividends to the amount of £4,400,000 since the company was formed in July, 1886. The Royal Commission report that gold has been found in various formations which the ordinary miner would never imagine to be gold-bearing. The cost of chlorination has been reduced from £2 8s 2d per ton in 1892 to 15s 7d per ton in 1897, this saving being the result of the erection of newer and more complete works, and the consequent saving in handling and treatment of the ores.

Queensland has an area of 427,838,080 acres, and the Royal Commission on Mining states that the area of the gold and mineral fields is 40,611,840, while the area held under gold mining leases (exclusive of ground held as claims or prospecting areas) is only 5,324 acres. The total amount of gold produced is set down at 11,198,900 ozs., valued at £3 10s per oz: equal to £39,196,465. There were 12,809 miners in the colony in 1896, and the gold produced was 640,385 ozs., giving a value per miner of £216 5s 3d.

NEW GUINEA.

Brisbane advices received say that the New Guinea gold fields, to which hundreds of Australian miners rushed in July and September, have proved a failure. At Mambare the natives were very savage, and a Brisbane syndicate of miners were rescued by Sir William McGregor after being besieged for three months by a large party of blacks.

At Mambare and at Normanby Island only medium finds were secured. There was gold in all the river sand and on the bars, but not in sufficient quantities to pay the heavy expenses. The Government is asked to help the stranded miners back to Australia.

Pacific Amalgamator.

PATENTED APRIL 20, 1897.

Why this Machine should be used in Gold Mills and Placer Mines: 1. It will make a large saving over the ordinary Plates, or any other Amalgamator. 2. It will catch float gold or quicksilver that may escape from the mortars or sluice box. 3. It requires less attention than the ordinary Plates. 4. It costs but little more than the common Plates; no other Plate required. 5. It is simple, durable, and the only sensible plan of amalgamation. **A Special Machine built for Klondike and Alaska.** Agents wanted. Address PACIFIC MINING MACHINERY CO., 127 First St., San Francisco, Cal.

British Columbia.

E. S. TOPPING, TRAIL, B. C.,

Has prospects for sale in Trail Creek and the whole of the Columbia basin. Will buy legitimate stock and mines for investors. Will examine mines. Has lots for sale in Trail and Deer Park.

SAN FRANCISCO ARTIFICIAL LIMB CO.,

MENZO SPRING, Proprietor,

Manufacturer of the BEST

✦ Improved Artificial Limbs, ✦

Office and Address, 9 Geary Street, San Francisco, Cal. (Junction Kearny and Market.)

Send for Measure Blanks for Self-Measurements; free to any address on application. Commissioned by U. S. to furnish Limbs on Government Orders. Artificial Limbs Repaired with Skill and Dispatch.

RUPTURE, Hydrocele, Varicocele, Piles, Fissure, Fistula, Ulceration, etc., cured without operation or detention from business. **NO PAY UNTIL CURED.** Consultation Free. Call or send for pamphlet

DRS. MANSFIELD & PORTERFIELD,
838 Market Street, San Francisco.

MINE SUPERINTENDENT required who is thoroughly practical and experienced in Hydraulic, Drift and Quartz Mining and Milling. Apply, with references, to PACIFIC EXPLORATION CO., 29-30 Chronicle Building, San Francisco.

FOR SALE, AT A BARGAIN.

A complete Champion Prospecting Diamond Drill Outfit. Good as new. Used very little. Does successful work. For price apply to GOLD HILL MINING CO., Angels Camp, Cal.

FOR SALE CHEAP.

First-Class Air Compressor (Steam driven) and Drill, New.

Also, 3-Ton Capacity Pulverizer.

A. L. FISH, 59-61 FIRST ST., San Francisco.

CALIFORNIA STUMP PULLER.

The Most Powerful Made!

Send for Illustrated Catalogue.

A. BARNES, Mgr., 82-84 Zoe St., San Francisco.

GOLD! Promoter and capital desired to put in operation a new phenomenal gold extraction method which also manufactures gold. Address Box 576, Lincoln, Nebraska.

WEST COAST OF MEXICO.

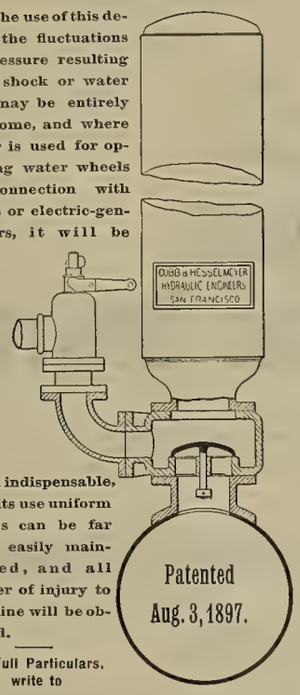
APPARATUS
—FOR—
Regulating Pressures
—IN—
PIPE LINES

By the use of this device, the fluctuations of pressure resulting from shock or water ram may be entirely overcome, and where water is used for operating water wheels in connection with hoists or electric-generators, it will be found indispensable, as by its use uniform speeds can be far more easily maintained, and all danger of injury to pipe line will be obviated.



Patented Aug. 3, 1897.

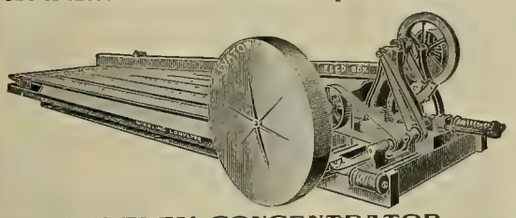
WILFLEY CONCENTRATOR.

PRICE $450 F. O. B. San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.



WILFLEY CONCENTRATOR.

SEND FOR CIRCULARS.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, barring none.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

AMALGAM PLATES.

Quick Armature Winding.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'S Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

Market Reports.

The Markets.

SAN FRANCISCO, Nov. 24, 1897.

As usual to a holiday week trade has been quiet. It is worthy of special note to state that general business in this month has been larger than ever before in the corresponding month. It is prevailing belief that business the remainder of the winter will be larger than before known during the corresponding time. While some of the older established houses complain of business not being in excess of last year yet they evidently forget that more firms are in business which naturally draw from them. The tendency of prices is to weaken all lines not influenced by higher freight rates from the East. This is largely due to market prices having been advanced too rapidly and also to consumers not taking so freely as had been expected. Persons returning from the East report active markets with the improving times working towards this coast. As a rule, all depressions and also all improvements are felt first in Europe, then at the East and last of all on this coast.

The local market is easy with a scarcity of commercial and other desirable paper. Although funds in bank are accumulating, still there does not appear any desire to press for loans; but with the turn of 1898 this is expected to change and lower rates of interest rule on unquestioned security. It is also stated that banks will not scrutinize so closely owing to the future holding out the promise for decidedly more prosperous times. When this obtains money seeks new avenues for investment, which will stimulate business in all directions. The East reports a plethora of funds, with a scarcity of commercial paper. Notwithstanding the large supplies at New York, funds continue to seek that city from central Western States. It looks very much as if there will be a big revival in speculation at the East when Congress' course on monetary affairs becomes assured.

New York Silver Prices.

NEW YORK, Nov. 24.—Following are the closing prices for the week:

	Silver in— London.	N. Y.
Friday	26¾	58
Saturday	26¾	58
Monday	26 15-16	58¾
Tuesday	27⅛	58¾
Wednesday	27	58¾
Thursday	....	....

	Copper.	Lead.	Iron.	Tin.
Fri.	10 75 @11 00	3 82½	10 00@12 25	13 70
Sat.	10 75 @10 90	3 85	10 00@12 25	13 70
Mon.	10 75 @10 90	3 87½	10 00@12 25	13 72½
Tue.	10 75 @10 85	3 87½	10 00@12 25	13 75
Wed.	10 75 @10 85	3 87½	10 00@12 25	13 75
Thur.	....	....	....	....

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	6
Commercial Loans, prime	5
Call Loans, gilt edged	4@4½
Call Loans, mixed securities	5@6
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	12½c Prem
New York Telegraphic Transfer	15c Prem
London Bankers' 60 days	$4.83¾
London Merchants	$4.82½
London Sight Bankers	$4.86½
Refined Silver, per oz. 1000 fine	58¾
Mexican Dollars nominal	46½@47

SILVER.—The market has been strengthened the past week, with the tone apparently towards still better figures. The firming up has been due to fairly free purchases abroad to meet the minting demand from one or two countries, chiefly Russia, which country seems to be preparing to put out silver coin to replace a considerable quantity of its paper currency. It looks as if there will be a large demand next year, owing to improved crops in silver-using countries.

MEXICAN DOLLARS.—The market continues fairly active, with China still taking large quantities. Dealers have strengthened prices slightly.

COPPER.—The market continues weak, with concessions obtainable on asking prices. The East reports slow markets, with an offish domestic and export demand. It looks now as if the European consumption will assume large proportions again. A circular letter from a leading New York house reports: "While some leading copper producing interests are not particularly anxious to press sales just now on the basis of present market values, nevertheless sufficient copper is procurable at 11c to meet the present demand. Inasmuch as Calumet & Hecla guaranteed their own price of 11½c on previous sales to their customers, they cannot be expected to enter the market until after the expiration of their outstanding contracts this year. Manufacturers have been quite busy of late, and this fact is a very encouraging feature of the situation, but on manufactured copper prices are very low compared with the former margin existing between the raw and manufactured article. European consumption keeps up to a healthy level, and statistics show an apparent increase in the consumption of copper in England, France and Germany. Official returns for Germany estimate the consumption of copper in that country for the first eight months of this year at 41,361 tons, against 32,175 tons during the same period last year. According to estimates, the current combined consumption of the three above-mentioned countries is at the rate of 189,024 tons per annum. European deliveries of 20,900 tons of copper in October are the largest of any month this year. The building of electric railroads in Europe is increasing, and some heavy contracts for equipping these roads have lately been placed with American manufacturers."

Our market is quoted as follows:

Ingot casting, jobbing	13 @—
Ingot " wholesale	12½@—
Sheet copper	— @16½
Bolt	¼ and 5-16, 20c; ⅜ and larger, 16½

QUICKSILVER.—The market is fairly firm. Exports the past week to Mexican ports aggregate 125 flasks.

Our market is quoted at $39 for domestic consumption and $35@36 for export to the west coast of Mexico.

LEAD.—The market is practically unchanged both on this coast and at the East. The past week there was shipped by sail to New York 3660 pigs.

Our market is quoted in jobbing lots as follows per 100 pounds:

Pig	4 75	@	5 00
Sheet	6 30	@	6 80
Pipe	5 60	@	6 10

On January 1, 1898, the Western Union Telegraph Company will discontinue its present system of New York lead quotations. After that date these quotations will be forwarded only as private messages. All ores have been and are sold to smelters on the basis of the New York lead quotations as sent out by the telegraph company. For the last few years several large producers in the West have expressed dissatisfaction with the system in vogue. They claimed that the Eastern smelters who made the quotations did not represent the actual sales or real market value of lead, and that the New York figures on which sales were made in the West were often below the price which could actually be obtained in the New York market.

The Eastern smelters have positively denied the allegations of the ore producers, and, as a result, no satisfactory conclusion has been arrived at.

SHOT.—The market is steady.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 40
Drop, B and larger sizes, " "	1 65
Buck, Balls and Chilled, do, " "	1 65

TIN.—The market is easy for both plate and pig. Sales of foreign plate have been made on the way from England. American is offering.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " " light, "	4 00@—

COAL.—The demand continues quite firm for all kinds at unchanged prices.

Receipts of coal for the week ending with Tuesday were as follows in tons: Puget Sound 2060; Swansea 10,523; Coos Bay 2000; Newcastle, N. S. W., 17,712; Nanaimo 6533; Baltimore 4000; Cardiff 1858; Sydney 841; Hull 1179. Total 46,706 tons.

COKE.—Imports the past week aggregate 1661 tons from England. The market is steady.

The market is quoted as follows:

Gas Companies'	— —		— —
English, to load	— —	@	— —
" spot, in bulk	11 00	@	— —
" in sacks	12 00	@	— —
Cumberland	10 00	@	— —

IRON.—The market is essentially unchanged. The consuming iron shows a slight falling off in this city, but it is expected to set in towards March of 1898 in increasing proportions. The East does not report any material change.

AMERICAN.	To Arrive.	Spot.
Sloss	$20 00	$22 00
Thomas	21 00	22 00
Salisbury	29 00	31 50
ENGLISH.		
Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

PLATINUM.—The market is firm.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

BORAX.—The market is fairly firm.

The market is quoted as follows:

Refined, in carload lots, in barrels	5½
Refined, in carload lots in sacks	5¼
Powdered, in car lots	5½
Concentrated, "	5

POWDER.—The market is steady.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¼c, according to strength and quantity; No. 2, from 9 to 11c, according to strength and quantity.

ZINC.—The market is firm.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

ANTIMONY.—The market is firm.

Our market is quoted at 8¼c in a jobbing way. New York mail advices quote 8c for Cookson's, 7¾c for Hallett's and 7c for Japanese.

Chemicals.

The demand continues slow in every line, with no improvement to look for the remainder of this year.

SULPHURIC ACID.—The demand is quiet.

We quote in a jobbing way at 1¾c per lb for 66%.

ACETIC ACID.—The market is firm at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported steady from store at 6¼@7c per pound in carboys.

BONEASH.—There is a slow demand at unchanged quotations.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

BLUE VITRIOL.—Our market is steady, with better inquiry.

We quote in a jobbing way at 4c per pound.

SPELTER.—The market is steady.

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is firm.

Our market is quoted in a jobbing way at $1.40 a pound.

PHOSPHORUS.—The market is steady.

We quote in a jobbing way at 70 to 75 cents per pound.

SODA ASH, 58% (LeBlanc process).—The market is steady at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is weak at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—The market is quiet at 2½c a pound from stores.

NITRATE OF SODA.—The market is easy for spot and shipment.

Our market is quoted from store at 3⅛@4c for 95%.

Mining Share Market.

SAN FRANCISCO, Nov. 24, 1897.

The past week has witnessed a continuance of the strong depression which has characterized the market for some time. The way in which the manipulator for the moneyed inside pool is handling the market creates the belief with experienced and successful outside operators that two or more bodies of ore have been found on the Comstock, and until the shares of these particular mines are well in hand no big move will be made in shares. While the share milking process is under way by the manipulator, there will be moves in individual shares by outside combinations provided these moves do not interfere with his game of beating outsiders out of their holdings. This, probably, accounts for the erratic moves at higher prices proportionately for some of the shares of the mines not thought much of. One of these mines has been examined by persons the past week who are said to be quite bullish. While they guarantee bull reports from the mine, the public would like to know who will guarantee them. Past experience has proven that under such a condition the shares go down to almost nothing, provided gudgeons buy. It is an open question as to how long the manipulator for the inside moneyed pool will keep the market down. It may be that lines of assessments and bear points put out will help in concentrating shares for the bull campaign which will come in 1898. The history of the Comstock is that after every strong depression extending on the down grade for many long, weary months, then a bull movement is inaugurated and prices carried up to good figures. The last big up-move was in 1888, when Confidence sold to over $60 a share; but the 1886 deal was the most successful, for the aggregate value of the shares of over twenty mines on the Comstock sold at less than $3,000,000 before it started, and in December of 1886 they aggregated over $60,000,000. The Sierra Nevada deal some years before this was also a great success, for from a total value of about $2,500,000 they went up to over $110,000,000. Before all deals of the above character, when prices were the lowest, bear points were as thick as blackberries during fruit season, and the old Comstock had no friend. Who knows but history may repeat itself within the next two years?

The news from the Comstock mines is far from discouraging to those informed on what is going on. In some of the mines the work is largely of a kill-time character. The intention seems to be to discourage holders of shares and make them sell at low prices. Persons in position to know assert that the entire complexion of things can be changed on the Comstock as soon as desired by insiders and that district made to hum again with general activity. From Utah and Andes nothing new from that heretofore published comes to hand. In Sierra Nevada they are still working on the Layton tunnel level. They are about ready to stope from the fourth floor. Returns from 155 tons of ore milled aggregate $2108 in gold and 1525 ounces silver. They are still pushing the Riley tunnel ahead.

They are still pushing the north lateral drift ahead from the 900-foot Union shaft level. In Union the work is confined to the 900-foot level, while in Mexican it is the 1000-foot level that receives attention. There is nothing new reported from either mine. In Ophir they are still crossdrifting west on the 1000-foot level and also central tunnel levels. The showing in the former shows an improvement, and therefore it is expected that it will be stopped soon. Attention is being directed to Con. Virginia. The work in this mine is on the 1550-foot, 1650-foot and 1750-foot levels. Those in position to know have faith that considerable ore will be uncovered before long. The last official letter is quite encouraging, although more time will be required to show what the result will be. They are still extracting and milling low grade ore from Gould & Curry. It will require the final cleanup and sale of bullion to show if it will pay. Fairly active work is being done in Savage. Nothing is being done in Hale & Norcross. In Chollar the work is the same as reported last week. They are going south on the tunnel level in Potosi. They are running a north drift for connection. It is stated that when ready a large increase in the quantity of ore can be extracted from this mine. In Alpha they continue to fool around on the 500-foot level. It is shares, not ore, that is wanted. From Overman and Alta nothing new comes to hand. A strong effort is being made to sell Justice shares, and for the occasion big bull points regarding what it will sell for are put out, and bull reports come from the mine.

From the Brunswick lode there is nothing of particular interest to report. It is stated that a leading mineralogist will inspect one or two of the mines, but unless he goes down and examines the lode on the Comstock tunnel his opinion will not be worth much. In Occidental they are still pegging away on the 550-foot, 650-foot and 750-foot levels. It will take well towards the close of December before they expect to reach the ore on the 750-foot level found above. In Chollar and Potosi the work reported last week is practically unchanged. It will take two or more weeks yet for practical results to be known from the most important work. From Savage, Gould & Curry, Best & Belcher and Con. Virginia nothing new comes to hand, although there are those who look for good results in the latter two before long.

The following illustrates the changes of the week:

Assessment Notices.

GOULD & CURRY SILVER MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2d day of November, 1897, an assessment (No. 82) of 20 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of December, 1897, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 29th day of December, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room 68, Nevada block, No. 309 Montgomery street, San Francisco, California.

BEST & BELCHER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2d day of November, 1897, an assessment (No. 63) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to to secretary, at the office of the company, room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of December, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 28th day of December, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. JAFFE, Secretary.

Office—Room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

CONSOLIDATED CALIFORNIA & VIRGINIA Mining Company.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3d day of November, 1897, an assessment (No. 10) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of December, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 29th day of December, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAENS, Secretary.

Office—Room 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

MARGUERITE GOLD MINING AND MILLING Company.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 4th day of November, 1897, an assessment (No. 8) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 237 Twelfth street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 13th day of December, 1897, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on SATURDAY, the 15th day of January, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

F. METTMANN, Secretary.

Office—237 Twelfth street, San Francisco, Cal. The secretary will also receive payments from 12 to 5 P. M. at his business office, 225 Sansome street.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of September, 1897, an assessment (No. 8) of 2½ cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 44, Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of November, 1897, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 29th day of November, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors of the Thorpe Mining Company the day of delinquence in the above assessment notice has been postponed to November 20th, 1897, and the day of sale to MONDAY, December 13th, 1897.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors of the Thorpe Mining Company the day of delinquence in the above assessment notice has been postponed to November 27th, 1897, and the day of sale to MONDAY, December 20th, 1897.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

SPECIAL MEETING OF STOCKHOLDERS.

Notice is hereby given, that a Special Meeting of the Stockholders of the New El Dorado Gold Mining Company will be held at the office of the Company, No. 310 Pine Street, Rooms 15 and 17, San Francisco, Cal., on MONDAY, November 29th, 1897, at 3 o'clock P. M., for the purpose of considering the sale of the stock now in the treasury, and approving a contract for the development of the Company's property. By order of the Board of Directors. J. W. PEW, Secretary.

Office—No. 310 Pine Street, Rooms 15 and 17, San Francisco, California.

MINE BELL SIGNALS.

Adopted, Used and in Force in Accordance with State Law.

For the convenience of our readers in the mining counties we print in legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco.

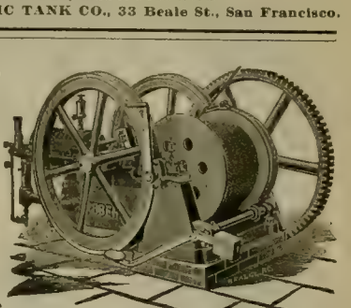
Weber GASOLINE HOISTING ENGINE.



MONEY SAVERS.

Costs to run One Cent per Horse Power per Hour. No Coal or Wood and very little water required.

This cut represents our 10, 15, 20, 30, 40, 50 H. P. Geared Hoist.

Saves $12.00 Per Day.

CHAPAREL, ARIZ., June 7, 1897.

WEBER GAS & GASOLINE ENGINE CO., KANSAS CITY, MO.—GENTLEMEN: The 10 H. P. "Weber" Geared Hoist you sent us has been in constant use since May 23rd, and is doing everything guaranteed by you with perfect satisfaction. Besides hoisting the ore and waste from the shaft with three 8-hour shifts sinking, it is kept very busy hoisting water, and has never been cooled off since we put it up and started it going. We were then 53 feet deep and we are now 108 feet. It will consume about ten gallons every twenty-four hours of 65 deg. gasoline, but I think when we can procure the 74 deg. gasoline, the consumption of fuel will be less. The engine was put up, started and has been run without our ever having seen a gasoline engine in operation before. Neither of the parties now running the hoist had ever had any experience with gasoline, and neither are professional mechanics. The engine hoists the loaded bucket with two men on top with apparent ease, starting loaded as easy as any engine can possibly do. I consider the hoist a complete success, and should I again have use for another engine, this would be my choice. Respectfully yours. GOPHER GOLD MINING COMPANY. Per H. B. Hanna.

Allard et als., in the Cambridge Mine near Plymouth, Amador Co., to deposit tailings on a flat; from W. O. Corbett and A. W. Carmichael, in the McMartin Mine near Onion Valley, Plumas Co., to deposit tailings behind the dam of the Good Hope Mining Co in Onion Valley Creek; from Geo. W. Mohler, in the Mohler Mine near Pike City, Sierra Co., to deposit tailings in a ravine below the mine; from Manuel Silva and Joseph Enos, in the Manuel Silva Mining Company's Mine near Cherokee, Butte Co., to deposit tailings in Spring Valley Creek; from J. H. Kneeland, Jr., in the Colfax Gravel and Pierce claims, near Colfax, Placer Co., to deposit tailings in Long Ravine; from L. L. Sherrod et als., in the American Gravel Mining Company's Mine near Centerville, Butte Co., to deposit tailings in ravines below the mine; and from the Kate Hayes Mining Co., in the Manzanita Mine near Sweetland, Nevada Co., to deposit tailings in the impounding basin of the old Manzanita Mine, gives notice that a meeting will be held at room 59, Flood Building, San Francisco, Cal., on November 29, 1897, at 1:30 P. M.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from A. A. Pond, in the Red Hill Mine at Todd's Valley, Placer Co., to deposit tailings in Todd's Valley Canyon; from Ralph Farnham, in his mine near Indian Diggings, El Dorado Co., to deposit tailings in Farnham Creek; from John Spaulding, in the Red Dog Mine at Red Dog, Nevada Co., to deposit tailings in Greenhorn Creek; from George Standart, in the Grizzly Mine near Pike City, Sierra Co., to deposit tailings in Grizzly Canyon; and from Thos. Wayman, in the Sunshine Mine near Pike City, Sierra Co., to deposit tailings in a ravine below the mine, gives notice that a meeting will be held at room 59, Flood Building, San Francisco, Cal., on December 13, 1897, at 1:30 P. M.

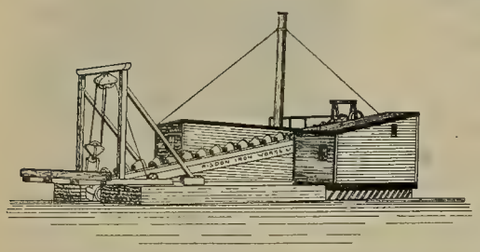
RISDON IRON WORKS,

MANUFACTURERS OF

Gold Dredging Machinery

FOR

★ YUKON ★ and ★ KLONDIKE. ★



Our MINING RIVER DREDGE is just the thing for placer mining in Alaska.
Shipped knocked down and, if desired, erected in running order.

WE ALSO MANUFACTURE ALL KINDS OF

MINING AND MILLING MACHINERY,
ENGINES AND BOILERS,
EVANS PAT. HYDRAULIC ELEVATORS AND HYDRAULIC GIANTS,
WATER WHEELS AND SHEET IRON RIVETED PIPE.

Office and Works: **Howard and Beale Streets, S. F., Cal.**

MINING AND SCIENTIFIC PRESS.
AND PACIFIC ELECTRICAL REVIEW.

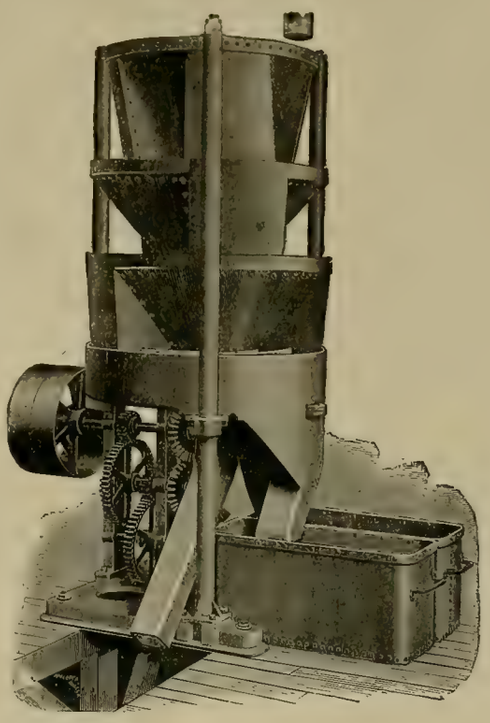
No. 1952.—VOLUME LXXV. Number 23. SAN FRANCISCO, SATURDAY, DECEMBER 4, 1897. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Double-Cylinder Gasoline Engine.

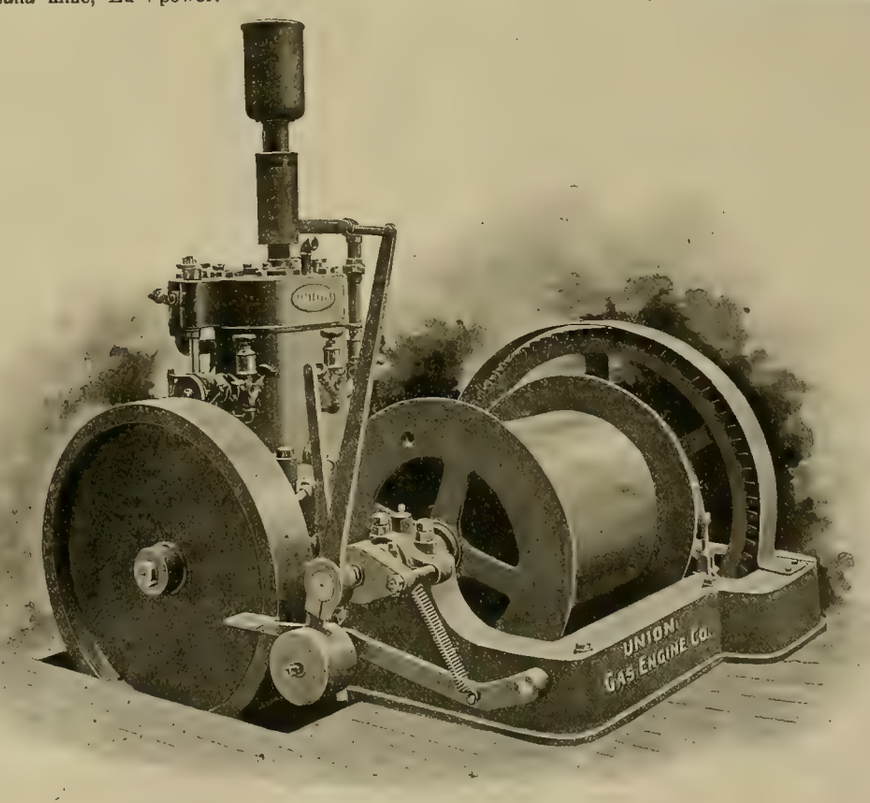
In the past reference has been made several times to the use of gasoline engines in mines on this coast. Herewith is illustrated a self-contained hoist, made by the Union Gas Engine Company of this city. This company has been building hoists for mining use for eight years. Within the last two years this self-contained hoist was put on the market, since which time it has been put in service in this country, Mexico, New Zealand and Australia. Previous to designing this hoist, the ordinary horizontal stationary engine with pinion and gear was used to drive the drum.

The illustration shows a 10 H. P. double-cylinder engine fitted to run on gasoline, naphtha, benzine, or distillate. The drum will hold over 700 feet of ⅝-inch cable, and it is intended to work to a depth of 600 feet. The makers guarantee it to raise one ton at a rate of 125 feet per minute. It can be started and stopped instantly, is equipped with a sensitive governor and uses gasoline in proportion to the amount of work it is doing; as hoisting is intermittent work, it is evident that this governing is of importance. The California Exploration Company has a 10 H. P. Union hoist at the Golden Hill mine, in Calaveras county, Cal., which, it is stated, costs only 45 cents per day of twenty-four hours. The one at the Belle mine at Tuttletown runs twenty-four hours per day on two gallons of gasoline. One at the Limpensil mine near Placerville costs 55 cents per day of twenty-four hours. These hoists have also been purchased by the Iron Chief mine, Pittsburg Coal Mining Company, S. S. Bradford, E. J. McEllin, Boundary Line mine, Plumbago mine, Crœsus Gold Mining Company, North American Exploration Company, Continental mine, Santa Rosalia mine, Eureka Mining Company, L. Booth & Sons, North Star mine, and Keystone mine. The Sterling Mining and Milling Company also has four Union engines, two of 60 H. P. and two of 25 H. P. The Pacific Coast Borax Company has six Union engines, five of which are hoists. The Pioneer mine has four engines, three of which are hoists. The Mammoth mill near Panamint is operated by a 25 H. P. Union engine.

The Union Company says over 2000 of these engines have been put out. The gas engine was originally a European invention, and is to-day much more generally in use in England and on the continent than in the United States. The pioneers of the Union Gas Engine Company claim the invention and development of the gasoline engine, which is essentially the same as the gas engine, excepting that it uses liquid fuel, which is turned into gas just before being drawn into the cylinder. In the Union engines no more is turned into gas than is needed to produce the required power.



BRIDGMAN'S ORE SAMPLING MACHINE.



UNION 10 H. P. DOUBLE-CYLINDER GASOLINE ENGINE.

Automatic Ore Sampling.

Recently was illustrated herein an ore sampler built by Supt. Chapman of the Idlewild mine, El Dorado Co., Cal., which works satisfactorily. The necessity of correct sampling, the need of accuracy therein is universally conceded. Several automatic ore samplers have been devised—the Bridgman, the Bradford, the Collum, the McDermott, the Constant, the Taylor & Brunton, and others. So many elements of error may possibly enter into hand sampling that a machine system of securing impartial work meets with much favor, any objections being outweighed by the many manifest advantages of the latter method. Herewith is illustrated Bridgman's ore-sampling machine "A," built by Fraser & Chalmers, Chicago, Ill., which gives double samples and three cuts (quarterings) on each sample. It is intended for original samples of any size, and gives final samples of about 1 or 2 per cent of the original weights. It requires a floor space 3 feet by 4 feet, and has a height over all of 7½ feet. Its average capacity is about twenty tons an hour. It is self-contained, requiring only to be bolted to the floor and to have feed, discharge and belt connections made. Fig. 1 on this page shows the machine as it is built. Fig. 2 on page 529 gives diagraphic sections and details. The machine consists essentially of three apportioners, I, II and III, all driven by the one pulley, X (usually tight and loose pulleys), and three stationary, concentric receptacles, R_1, R_2 and H, so constructed that any material falling into them will pass out through the spouts T_1 and T_2 into sample buckets Z_1 and Z_2 or through the spout S, which discharges the rejected portion of the sample. Apportioners I and III revolve in the same direction, apportioner II in the opposite direction; I at about 5, II at about 15 and III at about 45 revolutions a minute. The upper apportioner, I, consists of two concentric rings, divided by 8 partitions into 8 equal topless and bottomless compartments, L, from each one of which leads an adjustable spout, either as M–1, or as M–2, or as M–D. Set in rotation, spout M–1 would describe a certain circular path, 1–1; spout M–2 a certain other path, 2–2, and spout M–D a third path. The intermediate apportioner, II, merely a conical funnel, having, besides the large outlet W, four vertical shoots, N_1–N_1 and N_2–N_2, through its sloping sides; each one of these shoots forms one-eighth of the circular paths covered by the spouts M–1 and M–2 respectively. The lower apportioner, III, is of the same construction as II and bears the same relation to it that II bears to I.

Patents for Pacific Coast Inventors; Notices of Recent Patents, 543.

THE third quarterly meeting of the Pacific Coast Electrical Transmission Association will be held in San Francisco Feb. 20 and 21, '98.

SO FAR as known, W. P. Blake, now at Prescott, Arizona, put up the first rock breaker in California in the Benton mine, Mariposa county, in 1861.

AS NEARLY as can be estimated, there are at present about 6750 stamps in operation in California—about 1100 of these being in southern California. In Nevada county there are 760 at work.

THE principal transfer reported this week is that of the Royal Consolidated Mining Co., I. R. Wilbur, general manager, which has sold the Royal mine, about two and one-half miles northwest of Copperopolis, Calaveras county, Cal., to an English company for $400,000—$50,000 down, the balance in three installments.

IT would be in accordance with the eternal fitness of things to give a prominent place in the exhibit connected with the Mining Jubilee Fair in San Francisco next January to the original gold nugget discovered by Marshall. That historic little chunk is believed to be now in the possession of Mr. W. W. Allen, 323 Phelan Building, S. F.

LATEST authentic reports from Dawson City are dated Oct. 16. There were then 4500 people there with scanty provision for 3500. About 500 had then started down the Yukon to places where food was reported to be obtainable, and other wholesale departures were planned. Tales of starvation and suffering are not uncommon, and it is probable that extreme privation will be the lot of all in that region this winter.

THE proposition to have the Government build pipe lines from the California hydraulic mine districts watered by the Sacramento and San Joaquin rivers and their tributaries, to carry the debris into the tule lands, made many years ago, is again revived. The scheme is an extensive one and much may be said in favor of the idea. The tremendous cost, however, precludes present serious discussion of the project.

MR. R. W. RAYMOND, secretary American Institute Mining Engineers, states by circular that the 74th meeting of the Institute—its 28th annual meeting—will be held at Atlantic City, N. J., beginning Feb. 15, '98. It is intended at this meeting that excursions, entertainments, etc., shall be subordinated to the presentation and discussion of practical papers on mining and metallurgical topics. It is under consideration to hold a meeting of the Institute in Mexico, next October, in case a sufficient number of members signify intention of going, to warrant preparation for reception, entertainment, etc.

Very Unusual.

The Santa Fe Pacific Railroad deserves commendation for doing something so unusual in the history of California railroads as to be a matter of wonder, namely, issuing a booklet descriptive of a portion of California's great gold fields. The little volume is entitled, "Gold at Randsburg, California." It is handsomely issued and is being widely distributed.

It has been so long the policy of California railroads to hush up, so far as possible, any mention of the gold mines of this State, and to ignore their existence, that such unusual action on the part of any railroad in California borders on the wonderful. It is possible that some time in the next century, even the Southern Pacific may realize that it would be worth their while to follow the example of railroad companies in every other great mining region of the world and devote some effort to increasing business in that direction.

The railroads in Montana, Utah and Colorado—more especially the latter State—spend tens of thousands of dollars annually in issuing handsomely illustrated pamphlets, setting forth the great mineral resources of the regions they traverse; how they can be best reached; and, in many cases, giving exact geological and scientific information as to the character of the country and the chances for miners and prospectors. So far as has come under our observation, these pamphlets have not exaggerated the facts, but have been of practical value; and that they have aided the railroads in getting business and incidentally aided their respective commonwealths, goes without saying.

WITH regret is noticed, in connection with the State dredging, an avoidance of work authorized by the appropriation, and a continuance of the folly heretofore cited. It is now nearly nine months since the California State Legislature appropriated $300,000—the appropriation providing for the purchase of one or more large dredgers, to be under the direction of a Commissioner of Public Works, and to deepen the channels of the Sacramento and San Joaquin rivers. Since then, all the State of California has to show for it is a Commissioner of Public Works, at a salary of $3000 a year, a secretary and two engineers, at a salary of over $700 a month; and a contract to straighten some curves of the San Joaquin river, at a cost of $13,000, and to build some jetties at the Newtown shoals, at a cost of $17,000, making a total so far of over $40,000 for the money that was appropriated for the purchase of a dredger. The appropriation in no way, directly or indirectly, alludes or refers to any contract for "jetties," or "easements," or "straightening channels," etc. Everyone in and out of the Legislature understood just what the $300,000 was appropriated for, and so far nothing has been done but the maintenance of certain gentlemen in office at salaries at least as large as they could earn elsewhere. The thing is now degenerating into a farce. In the early part of the twentieth century we may have some jetties and a file of cashed State warrants—but nothing else—to show for the $300,000 appropriation in March, '97, in accordance with the urgent requirements of the case under the auspices of the miners and farmers alike.

A RECENT article herein, referring to the noncompliance of certain mining companies in Butte, Montana, with the law recently passed by that State Legislature requiring safety cages in mines, elicits the reply by the Montana Mine Inspector that the reason a few of the mines in Butte are not equipped with safety cages is that they would probably change from cages to skips at an early date; and because that he officially had not pressed the matter. It is further claimed that the new safety cages are not working successfully in some of the shafts of the Anaconda property; that the miners prefer to take their chances with the open cages; it is also claimed that, should a shaft be inclined to get out of plumb, the cage would become a death trap. If the law be obnoxious it should be repealed; but it would appear that because a few miners here and there object to riding in such cages, or that an occasional mine shaft, by reason of the swelling of the ground, etc., gets out of plumb, is not considered sufficient excuse on the part of officials, who have sworn to do their duty, to be recalcitrant in that regard. If the new devices are in reality "safety cages," they create additional protection; if swelling ground causes departure from the vertical, it shows that the timbers need easing. A shaft out of plumb is unfit to have any kind of a hoisting cage going up and down, "safe" or unsafe.

THE report of the Commissioner of Patents upon the business of the Patent Office for the fiscal year ended June 30, 1897, shows that there were received within that year 43,524 applications for patents, of which 23,994 were granted, including reissues and designs. The number of patents which expired was 12,584. The number of allowed applications which were by operation of law forfeited for non-payment of final fees was 5034. The total receipts were $1,343,779; the expenditures, approximately, were $1,026,644, leaving a surplus of $317,135. The moneys covered into the Treasury of the United States on account of receipts from fees, etc., in patent cases, from July 4, 1836, in excess of the cost of the management of the Patent Office, amount to $5,093,614. The accommodations are inadequate, and the niggardly policy of the Government in this matter is a constant subject of adverse comment. The nation owes it to its inventors to cease considering the Patent Office as a source of profit, and bestow some of the surplus upon requisite improvements at Washington.

THE Denver, Colo., *Mining Record* of Nov. 27th intimates that a New York mining journal and a Colorado mining journal are decrying the Beam Process because the proprietors of that process refused to advertise in those publications. Such a charge is a serious one. It is scarcely possible that the appearance or non-appearance of an advertisement of a "mining process" should influence any reputable mining publication in its criticism or judgment of the merits of such process. Such prostitution of editorial utterances is incredible. Readers of a mining journal are entitled to an intelligent and unbiased discussion of all matters connected with the mining industry, and an impression that its editorial opinions are purchasable, or influenced by the appearance or non-appearance of an advertisement, is and should be immediately fatal to that journal's influence. The two publications specified in the *Record's* remarks owe it to themselves to at once show that the charge is undeserved.

TO WARN the unthinking thousands who are preparing to rush to the Klondike next season has so far been a useless and thankless task. Those who are afflicted with acute Klondicitis must doubtless run their course even should the malady terminate fatally. Among their many mistakes one of the greatest is that they have educated themselves to the belief that the only obstacle between them and the coveted gold is that which is overcome by making the long and tortuous journey. They forget that the beginning of the search is only reached after they have arrived at the Yukon, and that as much intelligence is required in prospecting the gold belt in Alaska as is required in that which exists in the States. The idea that a fortune is to be picked up on the surface is one that many have erroneously embraced, and the disappointment will be accordingly intensified.

A COLORADO JUDGE this week made a decision of interest to miners of that State, to the effect that the workmen in or around a mine who are employed by a lessee have no claim against the property. Heretofore, in Colorado, it has been held that the workmen employed by lessees had a claim against the owner of a mine, and the result has been to work against the leasing system. It has been decided in California courts in case of a working bond or subleasing that where the owner or owners of the property gave due public notice of the fact that he or they disclaimed any obligation or responsibility for labor or supplies that the property could not be attached for any debts contracted by the bonder or lessee in connection therewith.

THE Secretary of the Treasury has advised collectors of customs at ports where works of manufacturers engaged in the smelting or refining of metals

from imported ores are bonded that, as the tariff act of July, 1897, differs from the act of 1894, it is deemed advisable to require the rebonding of such works. Under the new law it is provided that each day a quantity of the refined metal, equal to 90 per cent of the amount of imported metal smelted or refined that day, shall be set aside.

M. E.'s, E. M.'s and Experts.

Some remarks in the issue of Nov. 6th, discussing mining engineers, their requirements, qualifications, etc., have been widely reproduced. A writer in a recent issue of the British Columbia *Mining Record* speaks thus on the subject of "M. E.'s, E. M.'s and Experts:"

"That there are many men practicing as mining engineers in this province and elsewhere who have never had the necessary training is unfortunately too true. Real estate men, drummers, fishermen, insurance agents and so forth are all to be found here and elsewhere in this western country posing as M. E.'s or E. M.'s, and in more than one of the prospectuses which have been issued for the purpose of obtaining subscriptions from the British Pacific, the statements made to influence subscribers are those of men belonging almost entirely to the classes above. Should failure await such enterprises, can any one wonder? Only at the stupidity and gullibility of the subscribers. The so-called mining engineers may be to blame; as a rule there is an absence of evidence on that point, but the subscribers we know are to blame, and much more than they—the promoters who, in cases of the kind named, are only anxious to put before the public opinions that will induce subscriptions, altogether regardless of the merits or demerits of the properties offered.

In this connection let me repeat a story which may or may not be literally true. I give it as told to me. Within a hundred miles of the town of Rossland is a so-called mining engineer or expert who, when approached by a client as to the making of a report on any mining property puts the very pertinent question: "What do you want, a report on the facts or only a favorable opinion?" Asked as to his fees, he says: "A report on facts will cost you $500, a favorable opinion $2000." So long as there are people who want merely favorable opinions which will enable them to sell their "wildcats"—and unfortunately such people are not rare—so long will experts of the stamp alluded to find a vocation."

There is no effect without a cause, and where there is a supply it is almost invariably in response to a demand. To give a favorable opinion on a mining property it is not necessary to have the elaborate training of a mining engineer. Those most unfamiliar with mines can give a favorable opinion, and generally the appreciation is inversely proportional to their knowledge. The opinions so given need not necessarily be dishonest, for the so-called expert who has probably never seen the inside of a mine, or, at most, only been in a few short tunnels driven into the hillsides, is as easily gulled as the most ordinary layman who does not affect the expert's garb and initials. "Salting" for such men would be a waste of time.

Other types of so-called mining engineers are they whose vocation is, or has been, more or less associated with mines. It may have been as assayers or surveyors. Both these classes of men may, some day, make engineers, with other and more varied experience, as both of them have had part of the training necessary for a mining engineer, but to speak of either of them as a mining engineer would be as inaccurate as to call the tail board of a violin an instrument of music. This class of men usually realize, to some extent, their weakness, and by way of safety, if not prepared to sell favorable opinions, they "turn down" most of the properties inspected.

Of course, between mining engineers, who have had the necessary training, there are great differences; some have had much more experience than others, and even between those having equal experience there is frequently great disparity. A man's ability is compounded of two factors—heredity and environment. The latter includes education or experience, the former those mental and physical qualities which, in absence of a better name, are often called natural ability. "We do not come into existence as sheets of white paper on which the world can write anything it pleases"—either technically or morally.

Let us see what is required of a mining engineer. He may have to make topographical, geographical and mineralogical surveys, for which purpose it is necessary that he should have a thorough knowledge of surveying, stratigraphical geology and mineralogy. He frequently has to say whether certain ore deposits are or are not workable commercially, and to do that he must have a thorough knowledge of stratigraphical geology, mineralogy, the various operations of mining, the several processes of ore-treatment, the nature and uses of mining machinery, and the average life of different kinds of deposits. Or, again, he may have to conduct the operations of a mine already partially or wholly opened out. In that case, it is necessary that he should be a good stratigraphist, have a thorough knowledge of mining operations, the processes of ore-treatment, the uses of mining machinery, and also of the numerous subsidiary books required about a mine.

Of all the various kinds of work that a mining engineer is called upon to do, there is not one which demands such a wide range of knowledge as that of reporting on undeveloped properties, and yet that is the very kind of work so-called experts, who have had no experience in mining, profess to do. "Gall" alone could not brace itself to such presumption. Ignorance might, but ignorance and gall combined assuredly could and do.

It is of the first importance that a mining engineer should be practical, and that there may be no mistake about this statement we will define. By practical, as here used, is meant the facility of aptitude that comes to a man from constant practice of the particular pursuit in which after proper training he is engaged. A mining engineer cannot be produced in a college or chemical laboratory, although in both these places he will obtain part of his preliminary training; but it is on the mountain sides and in and about the mine and workshops that he learns those branches of his profession that are of the greatest commercial value. And let it never be forgotten that the mining engineer who is a commercial failure cannot be more than a very partial technical success. The man who cannot make his mining pay had better become an expert—at something else. It is sometimes contended that the best person to direct the operations of a mine is a practical miner. Let us see what truth there is in this contention. The experience of a practical miner is confined to pounding a drill, shot firing, driving a shovel and setting up timbers. These operations bear about the same relation to the complex requirements of a mining engineer that unconnected bolts, rivets and plates do to a finished steamship. If by a display of extra ability, or for any other reason, the miner finds himself acting as the foreman of a mine, his experience is a little widened, but not much; and if in later years he should chance to become a superintendent, he has then an opportunity of familiarizing himself with one or more of the various processes of ore treatment and the erection and use of machinery. But it will readily be seen that his experience even then falls far short of that necessary to the mining engineer. Not only so, but his preliminary training is altogether insufficient to enable him to discharge the duties of the latter. A mining engineer's general training should include—besides a good ordinary scholastic education—mathematics, physics, chemistry and geology."

MESSRS. BRICE of Chicago, Emmons of New York, Brazelle of St. Louis and Marshall of Nebraska have each declared their ability to manufacture gold, thus obviating the necessity of mining it. Mr. Brazelle alleges that "from common clay" he can "turn out gold, silver, iron, calcium, aluminum, and a number of other metals as yet unknown to science." His investigations have demonstrated that "there are but three primary metals—copper, lead and iron—which cannot be separated into component parts." He believes that by his process gold and silver will be turned out in such large quantities that all Governments will be compelled to demonetize them. The company which has been formed to work Mr. Brazelle's process will, however, considerately confine its operations to the manufacture of aluminum, calcium, glacium, and zerium, one of the new metals, which Mr. Brazelle says is destined to take the place of steel. According to the dailies Mr. Brice is about to begin the manufacture of gold in Chicago in such quantities as to destroy the vocation of the miner. Duly mindful of the requirements of the situation, Mr. Brice has begun contracting for antimony and has already engaged three carloads a week from Utah. There are possibilities in that direction in the Cœur d'Alenes, and, if Mr. Brice is financially able to purchase all the antimony offered, he may at least occasion increased market for that useful metal.

THE London *Mining World* of the 6th ult., in an unusually wise vein, discussing mining investments and advising against investments "in mines that principally come from the United States," says in answer to its own question, "Is There Any Mine That Can Be Called an Investment?" that the only approach to a mining investment in its judgment is the Rio Tinto, "where the quantity of ore seems limitless, and the duration of the company's existence so sure as to be outside of the calculations of this or the succeeding generation." If a limitless quantity of ore and a perpetual corporative existence be the two sole requisites that together make up a mining investment, such form of investment is, certainly, a very rare occurrence.

EDWARD ATKINSON, the distinguished American statistician who knows so many things that are not so, is now to the front with an assertion that "the average cost of mining silver all over the world is twenty-five cents per ounce," which is absurd. No man can anywhere determine the aggregate cost of mining silver. So many factors enter into that complex problem that those best acquainted with the facts hesitate to hazard even an opinion. It is only such as Mr. Atkinson who start with intent to make figures fit their prejudged beliefs that make positive assertions regarding this matter. When everything is taken into consideration it is probable that every ounce of silver produced "cost" and costs even more than the old time $1.29 per ounce.

PRESIDENT MCKINLEY'S annual message will be read to Congress next Monday. It is understood that in his policy of currency reform he will urge upon Congress the passage of a single simple measure to repeal the existing law which compels the Secretary of the Treasury to pay out greenbacks as fast as they are redeemed with gold, and also to provide that greenbacks, when once redeemed, shall not be reissued, except against deposits of gold equal in amount to the notes paid out. It is believed that such a measure, which has long been advocated in these columns, should receive Congressional approval. Its practical action would go far toward solving recent vexatious financial problems.

THE postoffice department at Washington has notified postmasters that newspapers and other periodicals containing advertisements of schemes offering prizes by chance, "missing word" and "missing letter" contests, etc., will be excluded from the mails. It is a matter of surprise that respectable journals have admitted such frauds. Even the *Scientific American* has given place to that species of advertisement. That class of advertising is rigorously excluded from the MINING AND SCIENTIFIC PRESS, which declines to aid in defrauding the public, whether it be by advertising bogus Klondike Transportation Companies, "missing letter" contests, or wild cat mining stocks.

THE traffic association at Hot Springs, Ark., declined to reclassify cyanide of potassium, and adhere to the old rate of $4.02 per hundred lbs. from the Atlantic seaboard. Manufacturers have reduced the old price to 25 cts., but the transportation companies propose to keep up the present tariff. That is a direct "cinch" on the consumer, and one that can be obviated only by the establishment of a factory nearer the cyanide plants of this west half of America. The New York companies that produce this article will see that it is to their interest that cyanide be laid down as cheap as possible. The consumption has increased twenty fold what it was six years ago.

Pyritic Smelting.*

By W. L. AUSTIN, Ph.D., Denver, Colo.

Under pyritic smelting is understood a smelting process which aims to utilize the calorific power of an ore. Pyrite (FeS_2), chalcopyrite ($CuFeS_2$), pyrrhotite (Fe_7S_8), aresecopyrite (FeAsS), blende (ZnS), galena (PbS), etc., are all ores which have calorific values as metallurgical fuels, and it is with the utilization of this quality in such ores that pyritic smelting has to do.

When a smelting ore contains in itself the fuel necessary for its concentration into a product which can be transported to market at a profit, a common practice is to destroy such natural fuels by calcination, and then smelt, with the help of coke, etc., the oxides thus produced. Why should we burn (roast) an ore which contains in itself a sufficient quantity of potential heat units to smelt it, and then smelt the burnt product itself with the assistance of more or less expensive fuel? Or, even when such an ore is smelted raw, why should we melt it down with coke—as if it were pig iron for foundry purposes—although we have dispensed with the preliminary roasting? In either case, such a proceeding must be considered as wasteful and extravagant if it can be shown that a heavy sulphide ore contains in itself a source of heat which, when properly applied, will suffice for maintaining a smelting temperature. When iron pyrites has been raised to a temperature at which its component parts are free to unite with the oxygen of the air, further use is as unnecessary as in the case of coal, which, when it has once been started, is self-sustaining. In the proper apparatus the same is the case with iron pyrites, which statement we see verified in the everyday practice of heap-roasting. In this process, and in the modern pyrites burners used by sulphuric acid manufacturers, the combustibility of the pyrites itself is relied upon to accomplish the end in view, and the carrying out of these processes demonstrates that, once ignited, pyrites will continue to burn till the sulphur is practically all eliminated and the iron is converted into oxide. It only remains to burn the pyrites more rapidly in order to produce a temperature high enough to fuse the whole mass, and this actually takes place unless care is exercised in restricting the amount of air admitted to the kilns.

Pure iron pyrites is a compound of iron and sulphur in the proportion by weight of 46.66 of iron to 53.34 of sulphur, and both of these elements may be burned in air when the proper conditions are provided to effect their combination with oxygen. The combination of iron and sulphur in iron sulphides of whatever class is not a combustible as long as the two elements are united. They must first be dissociated from each other in order to be free to enter into combination with another element; and it is only after such dissociation has been brought about, and the two elements find themselves *in status nascendi*, that their combustion may be effected. To dissociate these elements from each other, a certain amount of mechanical work must be done, and in the pyritic furnace this work is performed by heating the compound up to a certain point, when the elements separate from each other, and, if the proper amount of oxygen is then provided, they will unite with it. When means have been taken for supplying the proper proportion of air and pyrites in a manner conforming to the conditions under which they can best unite, the smelting will not materially differ, as far as the appearance of the furnace is concerned, from the usual operation with coke or charcoal, only in this case the pyrites supplies both the fuel and flux. That iron pyrites contains in itself the potential heat units requisite for its own smelting may be demonstrated by thermal calculations, or ocular evidence of the fact may be obtained by observing a Manlie's converter in operation. In the so-called bessemerizing of copper matte the molten iron sulphide is run into a converter, and air is blown through it until practically all the iron is burned off, the combustion of the iron (and incidentally of the sulphur connected with it) sufficing to keep the mass at a high heat and extremely liquid during the operation. If, then, iron pyrites contains in its combustible elements a sufficient quantity of potential heat units to support a smelting operation, then the use of carbonaceous fuel to smelt such ores is sheer waste, provided a suitable apparatus can be obtained for turning this quantity to economic advantage. Assuming that such an apparatus is at hand, deposits of this mineral so low in grade as not to permit of profitable treatment by metallurgical processes heretofore in use, may be handled economically at the mines themselves. In a well-managed mine the excavation of ore is controlled by assay, so that its value is known before it is mined, and thereby the cost of taking out worthless material is avoided. Such a preliminary assaying is all that is required where a fire concentrator is used, and there is no reason why the crude ore, just as it is mined, should not be dumped into the hoppers of a fire concentrator, as it is dumped into the rock breakers of a wet concentration mill.

Ores Adapted to Pyritic Smelting.—The first requisite in an ore to fit it for pyritic smelting is that it should contain enough iron combined with sulphur or arsenic to make an easily meltable slag, and to provide for a matte fall sufficient to cover the valuable metals contained in the charge. With regard to fusibility, practice has shown that the best slag for the purpose is a mono-silicate—one in which the oxygen of the silica is equal to that of the bases. To form such a slag requires different amounts of the various bases in common use. For instance, an iron mono-silicate calls for 29.41 per cent of silica to 70.59 per cent of ferrous oxide; a similar lime silicate requires 34.88 per cent silica to 65.12 calcium oxide. Substituting magnesia for the lime, we need 42.86 per cent of silica for 57.14 per cent of magnesium oxide; and for aluminum 46.68 per cent of silica to 53 32 per cent aluminum oxide, and so on. Now, to make a ferrous mono-silicate requires approximately four tons of pure pyrites to one ton of pure quartz, so we may say that for slagging purposes alone we need an ore mixture containing 80 per cent of pyrites and 20 per cent of silica; but that is using up all the iron on the slag, and does not allow for any matte fall. It is a well-established fact in smelting that a complex slag—that is to say, one containing a mixture of various bases—is usually more desirable than one consisting of only one base and silica. Therefore, where it is possible, we aim to make a slag containing several bases. If the ore charge is composed of pyrites and quartz in the ratio of 4 to 1, and we add to it limestone, we can form a lime-iron slag, still preserving our mono-silicate, and then have iron sulphide in excess, which is free to form matte. The addition of lime has another advantage; it lightens the specific gravity of the slag and renders it more easy to separate from the matte. If limestone is not available, then the same end may be reached by decreasing the amount of silica or by substituting some other base. When an ore is not of the desired composition—that is, when it does not contain 80 per cent of iron sulphide—other expedients must be resorted to; but it has been found in practical work that an ore mixture of the composition given will smelt readily without the assistance of carbonaceous fuel in the furnace, and will produce enough matte to effect a saving of 95 per cent of the valuable metals which it carries. It is seen, therefore, that pyritic smelting finds its limitation in the amount of silica contained in the ore it is desired to treat, and the opinion whether or not a given ore is suitable to the process is one which can be decided by chemical analysis. With practice, however, the operator can often determine by simple inspection whether his ore possesses the desired qualifications, but in cases of doubt a silica determination will set the matter at rest. Often simple panning will give all the information necessary. If a few pounds of the ore are ground up, the pulp weighed, and concentrated in a pan, the weight of the resulting sulphides will allow one to make a pretty close guess at the relative amounts of pyrites and quartz in the material under investigation. All that is necessary to be decided is: Does the ore contain enough iron in the form of sulphide or arsenide to flux off the silica, and form a mono silicate slag? If not, then are there other bases available in the neighborhood to make up the deficiency in iron?

There are various cements which can be utilized for cheaply and firmly binding even the first concentrates into forms suitable for blast-furnace work. The influence of zinc in pyritic smelting is one of considerable importance. The sulphide of zinc (blende) has nearly the same thermal value as the pyrites. Up to a certain point, any blende contained in the sulphide under operation assists the operation by its heat-producing qualities, the temperature resulting from the combustion of zinc sulphide being nearly as high as that of proto-sulphide of iron. In practice 14 per cent of zinc in the charge has shown no deleterious results. The zinc oxide, being a base, materially helps out any deficiency in iron, for the zinc is disposed to go into the slag rather than into the matte. Much of this metal is also carried off in the fumes, and in a properly constructed furnace every opportunity is given to assist its volatilization.

The arsenic, when arsenide of iron is used in the place of sulphide, separates from the iron readily under the influence of a pyritic furnace, and volatilizes, leaving the iron free to unite with oxygen. The results produced from burning arsenide of iron have been almost, if not quite, as good as where iron pyrites was used. The arsenic burns to arsenious acid and goes off in the form of heavy white flakes, which may be caught in suitable dust chambers. The burning of the arsenic yields also its quota of thermal units to the operation.

Any galena present in a pyritic charge is of assistance in producing heat, but the heat is difficult to save.

Style of Furnace.—In the experimental stages of pyritic smelting, circumstances compelled the use of whatever apparatus was at hand. For this reason blast furnaces were employed which had been built originally for other methods of smelting, and it is largely due to this precedent that furnaces intended for pyritic smelting continue to be built on similar lines, without sufficient consideration being given to the peculiar conditions under which they are to be operated. If results carried out in these furnaces do not come up to expectation, it will usually be found to be due to the fact that the experimenters have not a clear insight into the nature of sulphide fuels, and have attempted the impossible.

That furnaces built on the lines of those intended for lead-ore smelting are not adaptable to pyritic smelting purposes becomes all the more patent when the two classes of fuel used in the respective processes are considered. In the first place, coke is, for all practical purposes, a single element—carbon—and in the furnace it unites directly with the oxygen of the blast; whereas the sulphides are compounds of sulphur with some other element, and this union must first be broken up before the component elements can unite with oxygen. The author then enters in detail into the various changes which occur in the burning of coke and pyrites, and points out their respective differences of behavior while being acted upon by the action of the blast. To sum up, he continues, we have in coke a solid, consisting of a single element with a large surface exposed, which is retained in position until consumed; in the sulphides, heavy liquids of very limited surface, requiring dissociation of their elements before the oxygen can act upon them, and which rush through the charge in the briefest possible time. It is therefore unreasonable to expect that a furnace designed for burning the former class of fuel will be equally efficacious in the case of the latter. The products of combustion resulting from the two operations is a matter requiring consideration. In the case of coke, these are largely combustible gases, which pass upwards through the charge, carrying heat with them, and in this upward passage act upon the descending minerals. With sulphides, the products of combustion are principally heavy fluids, which drop downwards; the amount of heat carried upwards by the sulphurous acid gas and the nitrogen of the air being comparatively small. It is obvious, therefore, that the fusibility of the sulphides precludes the use of high smelting columns. In pyritic smelting, unlike lead smelting, there should be no carbonaceous fuel to burn away, nor oxides to reduce; any action of the ascending gases upon the charge is to be avoided, if possible. What is wanted is to melt the whole as quickly as possible without permitting a preliminary matting together of its component parts.

The best height for a smelting column in pyritic smelting is one which will present a sufficient resistance to the upward tendency of the blast to cause the latter to penetrate the center of the charge. This, of course, varies with different sizes of furnaces; a wide furnace requires a deeper charge than a narrow one. In order to be able to regulate the height of the smelting column and keep it stationary, recourse is had to an interior feeding cylinder. This contrivance is so adjusted as to deliver the sulphides at a given point in the furnace shaft, and at the same time protects them from the action of the escaping gases. In this way a constant height of smelting column is maintained, and the sulphides are delivered at a point where smelting takes place without permitting an incipient fusion, the heated gases being directed into other channels prepared for them. In order to make up the deficiency of heat which is absorbed in dissociating the sulphides before their component elements can combine with the oxygen, some auxiliary heat must be supplied; and in the Manlie process the air entering the tuyeres is heated by coming in contact with the molten mass, which has already been brought to a high temperature by the preliminary operation of melting the matte in a cupola before charging into the converter. This hot air then attacks the sulphides, and the burning of the sulphur and slagging off of the iron continues as long as there is any sulphide of iron in the vessel. All experiments, however, with low-grade ores, on the converter principle, have resulted in failure. There are various ways of giving the blast the necessary temperature before allowing it to enter the furnace—heating in hot-blast firebrick or pipestone, or in the tuyeres themselves. The first are costly methods, and the author recommends the gasifying of some cheap fuel by burning it in the tuyeres. The amount of heat necessary for the direct heating of the blast is comparatively small, and may be readily computed when the calorific power of the fuel and the volume of the blast are known. Owing to the charge column in a properly constructed pyritic-smelting furnace being of necessity low, and as the heavy globules of molten sulphide drop past the tuyeres very rapidly, the time during which the blast can act upon them is very short, so that it is necessary to use a higher pressure than ordinarily employed in Western blast-furnace practice. Care must be exercised that the volume of the blast is not too large, as if even a slight excess of air is blown into the furnace the cooling effect of the surplus air is very marked. What is wanted is pressure of blast, not volume. When the furnace is properly managed, the oxygen entering the tuyeres should be consumed to the extent that sulphur fumes will distill off from the surface of the charge, and may be collected and further utilized. In order to protect the workmen from the stifling gases given off by a pyritic furnace, and to provide for the regular charging of the ore and fluxes, the top of the furnace should be kept closed and a feeding device provided. Such an apparatus has been designed which is automatic in its action.

Concentration and Saving.—The degree of concen-

* Trans. N. of England Institute Mining Engineers.

tration effected in a pyritic-smelting furnace is in direct ratio to the amount of iron burned; hence, to make a good concentration the mono-sulphide must be retained under the influence of the blast until the desired quantity of iron has been converted into oxide. When no coke is used there is no reason why any desired degree of concentration should not be reached; but to accomplish this two smeltings are necessary.

The percentage of saving effected in pyritic smelting depends upon several factors, prominent among which are (1) the composition of the furnace-charge; (2) the amount of matte fall, and (3) the time given for the separation of the matte from the slag. The amount of the matte fall necessary to effect a given saving must be determined experimentally in each instance, for a hard-and-fast rule cannot be laid down which will cover every case.

When experience has been acquired in the operation of a pyritic furnace, and with the necessary amount of matte fall, a saving of from 95 to 98 per cent of the gold, silver and copper contained in a pyritic ore can, the author asserts, be realized in a properly constructed furnace.

The Estimation of Gold in Ore and Data on Dry Crushing Experiments.*

By FRANKLIN WHITE.

The following tables will show the possibility of assaying ore before crushing with sufficient accuracy to afford very useful information. One set of calculations refers to wet milling, one to a dry crushing test. I cannot give the name of the mine from which I obtained the first set, but the figures supplied to me, and which I am at liberty to use, are sufficient for my purpose. If we follow the usual system of taking the fine gold won together with the gold in residues (ascertained by assay) as equalling the total gold contents of the ore milled, we have the following:

NO. 1.

EXTRACTION.

	Ozs. fine gold.	*Per cent.*
Mill yield	13 095 14	67.61
Cyanide yield	2,655.27	13.71
Concentrates yield	1,138 74	5.88
Clean-up and slags yield	122.81	.63
Gold left on eight plates	200.00	1.03
Totals	17,211.96	88.86

RESIDUES, ETC.

	Ozs. fine gold.	*Per cent.*
Tailings residues	735.858	3.80
Concentrates residues	399.000	2.06
In slimes dam	1,020.188	5.27
Totals	2,155.046	11.13

	Ozs. fine gold.	*Per cent.*
Accounted for	17,211.960	88 86
Residues, etc	2,155.046	11.13
Totals	19,367.006	99.99

Making mineral worth 9.66 dwts. per ton. The mineral was assayed before being crushed, and the average value worked out at 10.3 dwts. per ton. When calculations are made on this basis we have the following:

EXTRACTION.

	Per cent of assay value.	
Mill yield equals	63.514	
Tailings yield	12.868	
Concentrates yield	5.518	
Clean-up, etc	.595	
Gold on plates	.969	
		83.464

RESIDUES, ETC.

	Per cent.	
Concentrates at 9 520 dwts	1.933	
Tailings " 0.515 "	3 567	
Slimes " 1.840 "	4.944	
		10.444
Unaccounted for		6.092
Total		100.000

Here we have a lower extraction to the extent of nearly 5½ per cent, and an unaccounted for 6 per cent, the latter figure clearly indicating that something is wrong. A glance at the assays of residue tailings and slimes will I think, show that they are too low. If the former were put at 1.1 dwt. and the latter at 2.5 dwts.—figures which would not discredit either the cyanide or battery manager—we should have an increase in the residue contents of over 1,100 ozs., and the "unaccounted for" would be reduced to a very small figure. Here, then, in the second set of figures, although the results given us do not absolutely check, we have a very clear indication of what was wrong. When once this was realized a remedy could be applied. In the former case, however, the manager would sleep comfortably in the persuasion that his extraction of 88.87 per cent was excellent.

NO. 2.

Test crushing (dry) of 917 tons oxidized from Botha's Reef.

CHARGES.

Tons crushed	917
Average assay	9 625 dwts.
Total gold contents	441.356 ozs.

RESIDUES.

Tons crushed	917
Average assay	2.708 dwts.
Total gold contents	124.245 ozs.
Theoretical extraction	317.111 ozs., or 71.84 per cent.

GOLD WON.

Bullion	374.3 ozs., equal to 290.3 ozs. fine, or 65.77 per cent.
In slags and sumps	13.6 ozs. fine.
Total accounted for	303.9 ozs. fine, or 68.91 per cent.

Fine gold recovered worth £1,203 8s 6d, or 26s 3d per ton.

The plant used was as follows: One No. 1 Gates crusher, three old vats holding 45 tons each, two 30-ton solution vats, and two zinc boxes—all second-hand. The vats leaked at first.

Treatment.—First 500 tons: Solution .25 to .3 per cent for 17 hours, then a weak wash of .13 per cent in all 24 tons per vat; final water washes 8 tons; total time, 38 hours. Remaining 417 tons (coarser stuff): Solutions .27 per cent to .32 per cent, standing for 72 hours, circulating the solution for 24 hours; weak washes and water washes as before; total time, 120 hours. Lime used, about 3 lbs. (unslaked) per ton. Cyanide consumed (leakage included), 11.2 ozs. per ton treated. The first 500 tons gave a theoretical extraction of 66.4 per cent; the remaining 417 tons gave 73.13 per cent, although the ore was very coarse, owing to the crusher head having worn. The ore was stoped and sent direct to the crusher, no drying being necessary.

Analysis of the Crushed Ore.—Samples from eight charges before and after cyaniding were separated into different sizes by sieving, and the resulting quantities dried, weighed and assayed, giving the following results:

Remaining on	¼-inch mesh	19.7 %; extraction	56.6 %
Remaining on	⅜-inch mesh	17 37 %; extraction	65.17 %
Remaining on	½-inch mesh	19 80 %; extraction	66 00 %
Passing	½-inch mesh	23.70 %; extraction	77.60 %
Passing	1-16-inch mesh	19.00 %; extraction	81.00 %

Some of the larger pieces would be 1½ inches in length. It is clear that if the ore had been crushed to ½ inch, which would not have been a very difficult or costly proceeding, a theoretical extraction of 79 per cent, or say 76 per cent actual, would have been obtained in one operation. The experience gained in the first 500 tons gave an increased extraction of 6.7 per cent in the second lot, so it is reasonable to assume that a second 900 tons would have given, if crushed to ½ inch, 82 per cent extraction at less expenditure of cyanide without amalgamation or slimes treatment. It is probable that more cyanide was used than was absolutely necessary, as in an experiment it is better to have too much than too little. Can the advocates of wet milling show a better result with the same expenditure in plant, work, and power? A sample of the same class of ore, but of better quality, so as to give more possibility for the presence of coarse gold if it existed, was crushed to pass a 400-mesh sieve, and submitted to Mr. A. F. Crosse to be tested. His report was to the effect that the ore assayed 14 dwts. 10 grs. fine gold per ton, the residues after five days' treatment 22 grs. per ton—equal to an extraction of 13 dwts. 12 grs., or 95.1 per cent. When calculated by the gold obtained from the cyanide solution, the extraction equalled 94.8 per cent. The free (undissolved) gold remaining was found to be 3 grs. per ton; therefore, no fear need be entertained that the coarseness of the gold would be detrimental to successful work. The decomposition of cyanide was equal to 11.2 ozs. per ton of ore treated.

Our president remarked during the discussion on treatment of battery slimes that in his works there was a difference between the theoretical and actual extraction, that the gold went in many different places, mostly lost around the works. No doubt there is loss in all methods requiring handling and mechanical treatment, but I think that the chief cause of discrepancy is want of precision in the weights taken; after that, errors in assaying. If once the gold reaches the vats, what is dissolved should be collected by the precipitation process or remain in the solutions, unless there is leakage, or loss in cleaning the slimes. Either of these cases represents an actual loss, the gold is neither in the residues nor in the bar. If our president is correct in stating that the notable difference between actual and theoretical extraction is due to loss, then the gold in the bar or slags plus the gold in the residues does not represent the whole of the gold originally in the tailings as received from the slimes separator, and Mr. Williams' contention that if you lose 100 ozs. fine gold in the residues, and have actually recovered 900 ozs. of fine gold in the works, it is fair to say that you have an actual extraction of 90 per cent, cannot be accurate. It is an extraction of 90 per cent of only part of the gold that was in the ore at the commencement of the operation. I am sorry not to be able to give to Mr. Williams a definite answer as to the cost per ton of the test crushing (dry) made at the Village Main Reef. The cost of such crushing, made with makeshift machinery, would be no guide to what could be done with a large and well-designed plant. The first 600 tons crushed was also experimental work, different meshes from 200 to 700 were used, and different strengths of solution and duration of treatment. Nevertheless, Mr. Feldtman's assays, carefully made, gave a theoretical extraction of 80.2 per cent, of which 64.4 per cent was accounted for, and I believe that had it not been for a leak in one of our ancient pumps that our actual extraction would have been fully 77 per cent. The remaining 400 tons, crushed to 500 mesh, which we found to be most suitable, was cyanided after I left the Village Main Reef, so I do not know what results were obtained; but charge No. 18, the first of the second series, gave a theoretical extraction of 89.25 per cent, the ore assaying 31 dwts. 20 grs. before, and 3 dwts. 10 grs. after cyaniding. In any case I do not consider that what we were able to do in any way exhausted the possibilities of the process we were testing for the first time on a reasonable scale. The perfection to which cyanide treatment has been brought here (members of this society have done a great deal towards this); the removal of financial obstacles, and the large quantities of ore of a remarkably even character with which we have to deal, are new elements which have to be taken into account in our endeavors to perfect a process for extracting the gold from the ore. We have to consider not only which may be the cheapest mechanical means of reducing this ore to a powder, but also and chiefly which is the method of crushing which will give us a product best suited to the subsequent processes of getting out the gold which are at our disposal at the present day.

Mr. Crosse, while thanking Mr. White for his paper, asked him if he would kindly put a postscript saying that the ore from the Village Main Reef is pyritic. He was sure the paper would be read with great interest all over the world, and he did not think he mentioned the fact that the ore was pyritic.

Mr. White: The ore was pyritic, and taken from a depth of 700 feet. The reason we took pyritic ore was, although there is a large amount of oxidized free-milling ore on the Rand, it is nothing compared with the amount of pyritic ore which will have to be treated in the future, so we preferred to make a test with pyritic ore, which some authorities considered untreatable by crushing and cyanide.

The Chairman: I am sure you will all agree with me that the paper is an interesting and most important one. In the first place, I think it is the first instance in which figures regarding dry crushing have been laid before us, and the thanks of this Society are due to Mr. White. I know that opinions regarding the dry crushing process are divided. Some are against it, while others claim that the process is going to have considerable success on the Rand; therefore I believe that the paper read by Mr. White will give rise to a good deal of discussion.

*Chemical and Metallurgical Society of South Africa,

Liquid Products of Wood.

Over 60 per cent of wood may be converted into liquid. The strongest hydraulic pressure would not squeeze one-half of one per cent of moisture from dry wood; but by putting the same material into an iron retort and converting it into charcoal by means of heat, the gases and smoke, to the extent of fully 65 per cent of the weight of the wood, may be condensed into pyroligneous acid, from which are obtained wood alcohol, acetate of lime and wood tars. A cord of wood weighing 4000 pounds produces about 2650 pounds of pyroligneous acid and 700 pounds of charcoal. The pyroligneous acid from one cord of wood produces nine gallons of 82 per cent crude wood alcohol, 200 pounds of acetate of lime and about 25 gallons of tar, besides 35 bushels of charcoal.

After the pyroligneous acid is neutralized with lime the wood alcohol is distilled off, the lime holding the acetic acid in solution. After the separation of the wood spirit, the remaining liquid is boiled down in pans to a sugar, which is dried, and becomes the acetate of lime in commerce. Acetate of lime is used for making acetic acid. Fully three-fifths of all the wood alcohol and acetate of lime produced in the world are made in the United States. A considerable quantity is also produced in Sweden, and at the exhibition now being held in Stockholm specimens may be seen. Over 15,000 acres of forest per year are cleared in the United States. Wood alcohol affords a perfect substitute for grain alcohol for manufacturing and mechanical purposes, and at less than one-third the cost. It is used principally as a solvent in the making of shellac varnish and in making celluloid and photographic paper. It makes beautiful dye tints, is antiseptic, and is used for liniments and for skin rubbing in bath-houses.

A NEW METHOD of smelting galena has been suggested. This consists of first treating the ore in an open-hearth blast furnace, and collecting the lead fumes, containing a large percentage of lead sulphide, driven off therefrom, treating the metal-bearing slag of the open-hearth furnace and the fume in a stack furnace, in which the temperature at the top is maintained at so low a point as to prevent the oxidation of the lead-sulphide fume generated in the furnace, and subsequently collecting the fume, containing a large percentage of lead sulphide, drawn off from the stack furnace, and smelting it in the same furnace, together with the slag from the open-hearth furnace. The results obtained from this process are said to have been satisfactory.

THIS gate requires only one pound of wire nails, 30 feet of lumber, and no tools except a square, handsaw and hammer. It is light, neat and strong, and does not require a carpenter to build it. To make a gate 5 feet high and 10 feet wide, take ten strips ⅞x3 inches and 10 feet long, saw two of them in the middle, lay two of these down, nail the long pieces to them, and clinch the nails; turn the gate over, nail the other 5-foot pieces on the other side and clinch nails. In the same way nail a piece on each way bias, for a brace, and a gate is made without any mortises to hold water. It can be made in an hour, out of dressed lumber, for 75 cents.

Mining Summary.

CALIFORNIA.

Amador.

The Argonaut mill was started on its initial run last week.

The *Record* says that W. Denis has sold the American mine to San Francisco parties for $30,000.

Butte.

At Forbestown the completion of the upraise from the big tunnel at the Gold Bank mine, believed there to be the longest upraise of record in the mining world, was celebrated by a public jollification. The raise is 1100 feet and the crosscut 1300 feet. Work on this tunnel began in August, 1894, and has been prosecuted almost continuously ever since. A prominent feature of the celebration was the presentation of a silver service to H. P. Stow, the mine superintendent.

In August, 1894, work was commenced on the tunnel, its mouth a mile and a half from the site of the Gold Bank mine. Work has progressed steadily ever since, night and day, and a tunnel 1900 feet in length has been driven through solid quartz. The object of the tunnel was to tap the main ledge of the mine at a lower level than that already reached. Thirteen hundred feet in from the main tunnel an upraise was commenced which was to connect with the main shaft. At its completion it measured 1050 feet.

Calaveras.

(Special Correspondence.)—At Murphys F. McNear has bonded the Heinsdorf Ranch and is sinking. On the Buckhorn he has let a contract to drive 300 feet on the vein. If the ore is satisfactory he will sink a shaft. Williams and Lane have stopped work on the Mexican. The tunnel on the Lady Washington, on Indian creek, has cut the vein. The old Wild Goose, Texas lead in the gravel channel at Douglass has just been reopened, and report has it is found as rich as formerly.

F. McNear of Oakland, operating the Buckhorn, is said to be getting high-grade quartz from the tunnel workings. He is also operating the Heinshoff mines on the townsite lines.

Cttizen: The Menareka mine near Camp Flores is being opened up by a Nevada company, J. Alcraz superintendent.

The Paragon has the mill nearly completed.

A strike of specimen rock has been made at the Greek mine, Eldorado district.

Prospect: At the Buckhorn, Supt. McNear, some quartz has been taken out of the tunnel workings. Mr. McNear is also operating on the Heinsdorff mines.

The Central Hill Gravel Compeny are waiting for water.

El Dorado.

There are 613 stamps; 304 at work.

D. H. Jackson has secured the Barbara quartz mine, in Gold Hill district, half by purchase and half by bond, from M. Varozza of Placerville.

At the Griffith Con., Diamond Springs, the ore in both shoots assays $16 per ton.

Democrat: W. R. Pearson recently examined the old Mt. Hope mine at Grizzly Flat; it has been decided to begin operations. A tunnel to tap the ledge much lower than the old one is already under way.

Gazette: Supt. Gayley is pushing work on the Bright Hope and adjoining claims. A 4-stamp double battery is expected to be in operation soon.

Nugget: At the Griffith Consolidated near Diamond Springs the ore in both shoots is reported assaying $16 per ton.

Humboldt.

The Standard Beach M. Co., at Eureka, has leased 125 acres of land for black sand mining, and purchased machinery. The results thus far are encouraging.

Inyo.

Register: The Molus is being worked. The main incline is down 180 feet, with drifts 30 feet westerly and 60 feet easterly. The ore showing is good.

Cowser, Fish and De Witt made a bullion shipment Tuesday, the result of a 20-ton run of ore from the Piute.

The Sagehen shows 6 to 8 inches of pay ore at its present depth of 50 feet.

Assessment work has begun this week on the Pine Mountain group. The Baltic mine gives average assays of 87 ounces of silver, 68 per cent lead, $9 in gold.

Kern.

The Kramer and Randsburg railroad camp is near Johannesburg.

In the Radamacher district a strike is reported in the Radamacher mine.

Miner: The Pinmore is taking out twenty-five tons of ore per day and milling it at Garlock. The first milling ran something over $8 per ton, and the second over $15.

A strike is reported in the Warrington mine, Havilab, a 9-foot ledge being developed on the 560-foot level. The Los Angeles G. M. Co. recently bonded the mine and has been developing it for the past month.

The new railway from Kramer, on the Atlantic & Pacific Railway, to Johannesburg will be opened for traffic December 5th.

Mariposa.

Gazette: The Merced Company have struck a rich chamber in the Mary Harrison mine.

G. L. Brown, for the Lafayette G. M. Co., has bonded the Gentry mine and has a crew mining the upper tunnel to tap the vein.

At Quartz Mountain F. Egenhoff, A. H. Ward and M. Wolfe have struck good quartz.

Napa.

The Vallejo Quicksilver Mining Company has levied an assessment 2 cents per share, delinquent December 18th.

Nevada.

(Special Correspondence).—Work in reopening the old Texas mine, a few miles from town, is progressing favorably. The property is owned by a San Francisco company. The two-compartment shaft has reached 120 feet. Hoisting works, office, the placing of machinery, shaft work, drain tunnel have been completed in a remarkably short time. The company has 120 acres and four parallel ledges within a radius of 500 feet. D. J. McFaull is the superintendent.

Nevada City, Nov. 29th, '97.

(Special Correspondence). — An enterprise of some importance, negotiations for which were closed here last Saturday, will add somewhat to the mining industry of California.

The St. Gothard M. Co., composed of S. F. people, most of whom are interested in the Champion mine near this city, in addition to the three claims on the old St. Gothard on which work was abandoned four years ago, have purchased the Delhi quartz mine (comprising three claims) which has likewise been abandoned for a number of years. The company acquires, in addition, a water right of 200 inches and 320 acres of timber. Work is already in progress reopening the tunnels of the Delhi, through which both this and the St. Gothard will be operated. The company contemplates erecting a mill of twenty-five to forty stamps at a point where they will have 1300 feet pressure. F. Zeitler is president, Gus. Katschoke vice-president and A. H. Bigelow superintendent.

Nevada City, Nov. 30th, '97.

Transcript: The Benton and the Murchie drift mining companies are engaged in running a tunnel between Big and Little Deer creeks. They expect to strike the channel at 1400 feet, and that from six to eight months will be consumed running it. The headquarters are in San Francisco, the president being G. T. Emery. Each company has a capital stock of $300,000.

Transcript: The La Belle, Willow Valley, is being developed by J. L. Postlethwaite. The tunnel is in 400 feet; from it are four upraises. The tunnel gives 700 feet of backs at the highest point, enabling work to be carried on without machinery and at moderate cost. The ledge averages about 18 inches in thickness and the crushings now being taken out will mill $25 a ton.

The new hoisting and pumping rig at the Texas mine in Willow Valley has started. The three-compartment shaft will be continued down and drifts run.

At the Maryland the developments on the 1600 level during the past week have been such as to warrant putting in place again the machinery that was taken out awhile ago. The present indications are very favorable for this mine.

It is stated on good authority that the last monthly clean-up at the Massachusetts Hill mine amounted to over $100,000.

Placer.

L. Waugh and F. B. Norton, who bonded the Hope, located between Auburn and Ophir, have struck some fine rock. The ledge is about 12 inches.

F. Chappellet of the Eureka estimates the distance of the main tunnel to be driven before making the upraise to tap the channel to be 600 feet.

Colfax *Sentinel*: An English syndicate, with E. W. Chapman manager, has acquired several miles of tailings between Colfax and Dutch Flat, which cover the river bed from 18 to 24 feet in depth.

The gravel in Bear river came from the rich hydraulic mines of You Bet, Little York, Lowell Hill, Gold Run and Dutch Flat. Much of the gravel in those large mines was cemented.

A flume taking water from South Yuba canal has been built 4680 feet. The water is then conveyed 3620 feet in a pipe line to the hydraulic elevator, giving a pressure of 450 feet. H. Quine is superintendent.

A French company has begun development of the Maus quartz mine, east of Forest Hill. They will sink a two-compartment shaft 200 feet, from which they will crosscut the ledge. F. Roumage is superintendent.

Plumas.

G. A. Hall discovered a small rich vein from which he extracted thirty-one tons of ore and realized $1125.

Independent: At the West Elizabeth mine between Popular and Nelson creeks, upon which thirty thousand dollars has been spent in prospecting by tunnels and otherwise, gravel prospecting well has recently been struck in the workings. The property is under lease to R. A. Gumbert, Pittsburg, Pa.

The Plumas Eureka Company have suspended mining operations for the winter, and leased the mine to their former employes.

The West Elizabeth mine, upon which $30,000 has been spent in prospecting, has been leased to R. A. Gumbert of Pittsburg, Pa.

San Bernardino.

Nearly 300 mining locations were filed from Jan. 1st to Nov. 1st. There are 220 stamps, of which 145 are dropping.

San Diego.

Receiver C. W. Pauly, in charge of the Free Gold Mining Company's mines and mill at Hedges, says that 200 men keep 100 stamps busy, crushing 400 tons of rock per day. The Cross, Crown and Queen mines furnish the ore. The stamps weigh 1000 pounds each, and the power is furnished by a double compound condensing engine of 300 H. P. There is a dynamo, and the mill is lighted by electricity. The deepest shaft in the camp is 600 feet. The ledges run from 8 to 40 feet in width, the rock entirely free milling quartz of low grade. The gold is very fine—so fine that much of it is lost in milling. It is estimated that there are $600,000 or $700,000 in the tailings. They are to be cyanided. A pumping plant, which cost $75,000, is at the Colorado river, twelve miles from the camp. October's clean-up netted $46,000.

Shasta.

(Special Correspondence).—In and about Redding within a space of fifteen miles there is considerable activity in mining circles, despite the lateness of the season. The historic little town of old Shasta, six miles from here, is demonstrating that it is strictly in a paying quartz region. The several roads leading to the smelter at Keswick are a continued scene of wagons laden with ore. The ready sale of ore for fluxing purposes has brought about the development of properties that were never supposed to be of a mineral character. The supposition that has erroneously gone abroad that Shasta is not a good county for successful mining is being rapidly disproven by actual ore productions in fair-sized ledges and of good value. It is true the ore is not all or everywhere of a free milling nature, but even as a smelting proposition ores that run from $20 to $300 per ton are certainly remunerative, and Shasta has an abundance of them.

Redding, Nov. 29th, '97.

About 3,000,000 pounds copper ore were fired at Keswick last week, piled up along the line of the Iron Mountain Railroad, the largest pile of ore ever fired at one time by the Mountain Copper Company. The fire will burn from sixty to ninety days, when the ore will be conveyed to the smelter. The sulphur smoke has killed vegetation for miles around Keswick; forest trees and orchards for three or four miles are dead. The smoke is evidence of the great industry that has made Keswick the liveliest mining camp in the northern half of the State. A payroll of $30,000 a month is the apology for the sulphur smoke.

Santa Barbara.

The Alcatraz Asphalt Company at its new asphalt works at Sisquoc has a tramway to the top of the mountain deposit of asphaltum. Boilers and tanks are on the premises, also hoisting apparatus and other machinery.

Sierra.

At the Primrose, from which $400,000 has been extracted, the Victoria Mining Company of Oakland proposes to resume work.

Siskiyou.

Journal: The Minetta B mine is in operation.

Several of the placer claims on the Klamath river have started up, the late rains having furnished them with a supply of water. The larger claims, however, cannot start up until the supply of water is sufficient to run their giants.

In the Oro Fino district, as soon as there is sufficient water, the Eastlick Bros., S. Gardner and Wright and Fletcher mines will all be in operation.

J. W. Wheeler has bonded the Bonnie and the Olga to W. E. Morris of Portland, Oregon; machinery is being placed on the ground. J. O. Rusby will have charge.

John Costello made a rich strike in quartz on Indian creek, uncovering a ledge 18 inches in width, which he estimates will go at least $50 per ton.

Trinity.

J. Travers, on the Advance mine, is driving a tunnel to cut the ledge. The tunnel is 160 feet.

Tuolumne.

(Special Correspondence).—"Surely there is a vein for the silver, and a place for gold where they fine it."

Ten years ago Tuolumne was called a pocket county and the capitalists would have none of her mines. To-day these same capitalists are offering for single properties what then would have secured all of the mines in the county, and are surprised to find their offers "declined with thanks" by the same owners. If Job were alive to-day he would correct his oft misquoted saying and change it to "the gold is where you find it, and that is in old Tuolumne." From timber line to the plains, from the Mariposa to the Calaveras side, the mines are all booming; everywhere the same satisfactory results are being obtained. The Sugar Pine district sends down news of old mines reopened and found richer than ever. The granite belt proves richer with depth, and the ore bodies not only live but widen out as the shafts go down on them. Along the mother lode there is an almost unbroken string of mines that vie with each other in the size and value of their ore bodies. Steam is wafting from every hilltop, while the roar of the stamps makes music for the fortunate Tuolumne miner. The county, as a whole, feels the impulse given to every branch of industry and the towns grow apace, while the railroad finds it policy to extend its lines to Tuolumne's mines, that it may, while adding to the general prosperity, secure its share of the general wealth. Tuolumne has awakened from her long sleep, and surprises, not only the visitor, but herself as well, with the wealth she is to-day unfolding to the fortunate owner of her golden lands.

Columbia.—Several companies have recently taken hold of the old gravel mines of this section—one of them from Circle City, Alaska—showing that Tuolumne can offer superior attractions to that frozen zone. To the east, the old Riverside is again running, with Dr. Plank in charge. Mr. Barnard has the Keltz in full swing. The Star is receiving new machinery and promises to reward the Willman brothers with ore as rich as that of the past. The Old Tuolumne, with R. G. Davis superintendent, is driving a tunnel to tap the ore bodies 1000 feet deep. At Summersville (now called Carters) the Dead Horse has awakened after a sleep extending from the 900 to the 1000-foot level, and is to-day in better ore at the 1450-foot level than at any time in the past history of the mine. It is the intention of Supt. C. H. Thomas to now put the shaft down to the 2000-foot level. At the present time the ore bodies are 8 feet wide on one wall and 6 feet on the other, with casing between. Between the 700 and 900-foot levels large ore reserves are still standing, that have been left to work out from below, and use the waste for filling the lower levels. The 20-stamp mill is running steadily.

Cherokee.—This section is coming to the front on account of the recent strikes in some of the old mines that have lain idle for many years. The officers of the famous Dutch mine have secured the old Easton or Yellow Jacket mine, together with the Ophir and Good Luck mines adjoining. The mines have been renamed the Dreisam by their fortunate owners. That "a good name is more to be desired than great riches" in mining, as well as in other pursuits, was shown in the Dutch stockholders subscribing for all of the stock of the company within twenty-four hours after the first call. In the past the mine when worked by Easton gave the owner $90 a ton in free gold, the sulphurets not being saved. In sinking the Cutter vein was encountered, which cut the vein off, and it was dropped. Recently a party of Italians reopened the mine and found that the Cutter vein had simply caused a throw or fault of the vein, and at 40 feet from its former position the vein was again found in place, the ore extracted by the Italians giving them $800 from six tons of ore. The present owners have sampled the vein thoroughly and find that it carries an average of 4 per cent of sulphurets of a value of from $200 to $700 a ton, while the ore samples $212 at the point now open. The vein at the present depth averages 26 inches. The vein is in granite, which accounts for the high values. The property is in charge of C. P. Grimwood of the Dutch mine, who has contracted for a hoist and is rushing work on the mine, to be in shape before the winter storms.

The Carlotta and Pennsylvania mines, D. Nagle, superintendent: These old mines laid idle since their old owner (Symonds) was killed in the mines. The new owners put the Pennsylvania shaft down 20 feet deeper and opened up an ore body that shows ore of a value of $700 a ton. On the Carlotta vein a few feet of sinking changed the character of the ore until it is now a good second to the Pennsylvania. Mr. Nagle very modestly says: "Call it a $40 proposition on the Pennsylvania and $20 on the Carlotta at this time," while admitting that the selected shipping ore goes $600 to $700 a ton and that 25% of the ore is shipping ore. The vein is in granite. The shaft on the Pennsylvania is now down 110 feet; that on the Carlotta 190 feet. The Carlotta vein at this time is 14 inches wide; the Pennsylvania 18 inches. The mine is said to be owned by some of the officers of the S. P. R. R. The Porto Fino is being developed under bond by J. Richards & Co. The ore in the Porto Fino is of the same character as that of the Carlotta, and is in granite.

Soulsbyville.—The Soulsby, W. Sharwood, superintendent: This mine is equipped with hoist to go 2000 feet, rigged for steam or water, and has a 15-stamp mill. All of the work on this mine is of the most substantial character. In the thirty years that Mr. Sharwood has been operating in the mines of Tuolumne it has never been necessary to take down or rebuild any plant that he has erected. The worst that his critics can say of him is that "he has the English habit of building for all eternity," which is the best recommendation any mining superintendent can have. In the past the Grizzly and Soulsby were the two first mines of importance in the county. The properties were owned by Soulsby and Donald Davidson, who vied with each other in the size of their bullion output; but the Soulsby with its $10,000 a week kept steadily in the lead of the Grizzly, as it followed after with its $7000 a week. The Soulsby has produced about $3,000,000, worked to a depth of 800 feet on a vein that averages 18 inches, with an ore value of $35 a ton. The present company has reopened the old Pennsylvania shaft, about 1200 feet south of the Soulsby shaft, and put it down 225 feet, the ore extracted milling from $35 to $75 a ton. The present company's property covers 6200 feet on the vein. At present the mine is closed down during a misunderstanding among the stockholders.

The Grizzly, W. Sharwood, superintendent, is being reopened. The new shaft is now down 220 feet and will be put down to 400 feet before drifting. The Grizzly is 3000 feet south of the Dead Horse, on the east bank of the North Fork of the Tuolumne river. The vein in the old works was all the way from 2 to 16 feet in width. The hoist is run by water power from a turbine with 24-foot head. The power is conveyed 300 feet by wire cable, which Mr. Sharwood states is very satisfactory when properly installed. Mr. Sharwood is placing piers in the river preparatory to erecting a bridge over the river. South of the Soulsby is the Junction, W. Storms, superintendent. Mr. Storms is here developing the Black Oak vein and is down 104 feet. The vein is showing up finely. In fact, the Junction is admitted to be richer at this depth than the Black Oak was.

The Black Oak, W. P. Scott, superintendent: The company's mines include the Black Oak, Live Oak, White Oak and Carrie. The shaft is now down 730 feet on the vein. At present the work is all on the north shoot, which shows a length of 500 feet on a vein 10 to 30 feet wide of ore that the owners ship 20 per cent of to Selby and realize an average of $90 a ton, while the remaining ore averages $21 a ton. The mill is of twenty stamps. The ore is heavily sulphureted, the average value being $200 a ton. The sulphurets are shipped to Selby's. The tailings from the mill are treated by the cyanide process and 75 per cent of the $4 value recovered. The mine has a new Rix air compressor, direct driven, of 100 H. P., and at this time the Angels Iron Works are putting in place a Cornish pump similar to that on the Rawhide, with 12-inch pipe and calculated to go 2000 feet. A Gates canvas plant is also being built. As will be seen, the Black Oak has the largest body of high-grade ore of any mine in the county, if not in the State. The vein is in granite.

The Gold Bug, Mr. Woodrow, formerly of the Santa Ana of Angels, in charge: The shaft is now down 80 feet on a vein 18 to 20 inches in width. Ore is said to be very rich. Vein in granite.

Draper, W. B. Moore, superintendent: The shaft is now down 350 feet and sinking. Vein 18 inches to 6 feet in width, with an average of 2 to 4 feet. The ore of the Draper goes

from $40 to $250 a ton; the sulphurets $500 a ton. Mr. Moore intends to sink to 400 feet and drive out levels both ways. As every mine that Mr. Moore has taken hold of in Tuolumne has proven a good one, and some of them the largest and best mines in the county, his friends predict that the Draper will follow suit. The Draper is in granite.

Over to the north of Soulsbyville is the Hazel Dell, owned by W. Sharwood. The shaft is down 80 feet on a vein 1 to 3 feet in width, with a value of $14 a ton. The ore carries a large per cent of $50 sulphurets. The mine is bonded at this time to a Mr. Easterbrook.

Sonora.—South of Sonora, J. L. Josephs has the shaft on the Gerrymander down 230 feet and drifting on a vein 9 feet wide and another of 10 to 14 inches. Ore from the small vein gives returns of $370 a ton. The company has just erected a 5-stamp mill. Mr. Josephs is also developing the Marble Point mine, eight miles above Summersville. The mine is opened by a tunnel 90 feet long on an 8 foot vein.

The Golden Gate mine, F. Littlefield, superintendent: Mr. Littlefield has been on the mine but three months, yet during that time he has remodeled the plant from one end of the mine to the other. The gallows-frame that is just completed is of timbers 18 inches square. The arrangement of the ore bins in the frame is such that all the space is utilized in bins for waste and ore, while the plan of the rock breaker is such that it feeds itself and can readily be got at on all sides. In the mine the work is now all confined to the upper levels, more being in sight there than can be worked out in many years to come. The vein averages 8 feet of $16 ore. The ore carries its values almost in sulphurets, which are chlorinated in the company's own plant.

The Mother Lode.—Jumper, M. D. Kelly, superintendent: The shaft is going from the 500 to 600 level. To the north the company is sinking an air shaft. At present they are working the center vein. The mine's mill is of twenty stamps. Other mines hint at their values, but on the Jumper they can always take those interested into their treasure room and show box after box of ore in which the gold is seen in solid streaks a quarter of an inch in width. The Jumper now embraces the Jumper and the New Era.

Golden Rule, O. N. Parvin, superintendent: The shaft is now down 500 feet, between the west and middle vein, with crosscut going to the west vein. The veins have been cut east, 9 to 21 feet in width. The mill is of ten stamps. This mine, like the Jumper, can show exceedingly rich ore in large quantity.

Santa Ysabel, E. A. Hardy, superintendent: The mine is opened by four shafts, No. 1 or south shaft is down 200 feet, No. 2, 300 feet, No. 3, 700 feet, No. 4, down 80 feet and will be continued to 1000, when it will cut the vein. The property consists of the Miller & Holmes, Knox & Boyle, Grey Eagle and Nyman No. 1 and 2. The company use electric power from their own plant and find it very satisfactory. The mill is of twenty stamps.

The App, W. Morehead, superintendent: The shaft is now down 1000 feet and a crosscut is being driven to the old Heslep vein which was worked by Bowman to a depth of 800 feet and showed a width of 125 feet. In the App the two veins have been developed. At present the mill is running on the west vein which is 35 feet wide of very good ore. The pitch of the veins is such that at 1200 or 1400 Mr. Morehead thinks the App and Heslep veins will join and make one immense ore body. The property embraces the App and Heslep.

The Dutch, A. Trittenbach, superintendent: The shaft is now down 500 feet and will be sent down to 1000 feet and crosscuts driven to the vein east. At present a crosscut is in at the 500 level 75 feet and no wall reached. In the Dutch all the veins of the mother lode are in it, within a width of 300 feet. In consequence the company can expect in depth to have a vein of at least 300 feet in width. The mill on the mine is of twenty stamps. The power is steam which will be materially cheap now that the railroad has made it possible to buy and use coal at low rates. The superintendent's residence on the Dutch is the finest on the lode, while all the appointments of the mine are up to it. The Dutch is without doubt one of the best mines on the mother lode.

The Sweany is idle.

The old Whisky Hill is now the property of the Santa Ysabel Co. and has been robbed of her old name and dubbed the Trio, with J. P. Munger superintendent. The shaft is now down 250 feet and sinking to 1000 feet. As is well known to all old-timers the Whisky Hill has been "gophered" for a width of over 600 feet. The surface indications were so good that the present owners paid $100,000 spot cash for the property to Hayward and Preston and will no doubt find a good property in the old "Whisky Hill."

Harris' old mine, the Gem, is idle, as is the Crystalline to the north. On the Alabama Supt. W. E. Nevills is sinking in the mine's old open cut and has the shaft down 320 feet. A crosscut will soon be driven on the vein.

The Rawhide, W. A. Nevills, superintendent: The mine is the property of Messrs. Nevills, Ballard and Martin. The shaft is now down 1200 feet. The reputation of the mine is that of a large ore body of average ore with frequent bonanzas that bring the mine's output well up. The mine has a 40-stamp mill and chlorination plant of ten tons capacity a day. The company has built a ditch, put up its poles, wired them, and expects to soon have its own electric power plant of 1000 H. P. from their electric plant on the North Fork of the Tuolumne. The power will be carried 12½ miles.

Rappahannock, W. Chute, superintendent: Mr. Chute has the shaft now down to 650 feet and is putting in place a hoist to go 2000 feet. As soon as it is complete the shaft will be continued to 1000 feet.

Alameda, B. McConnell, superintendent: The shaft is now down 500 feet on the foot wall vein, with a crosscut of 35 feet to the vein, and a crosscut of 135 feet in the vein, and no walls reached. The company intend to erect a mill next spring.

The Tarantula, G. H. Redding, superintendent: The shaft is now down 200 feet on the 23-foot vein, all milling ore, while the vein matter is over 150 feet wide. The vein on the surface was but 1 inch in width where it cropped. The ore values are high, and were so from the grass roots.

Tuttletown has leaped to the front as a mining center. The Golden Star, Thomas M. Park, superintendent: This mine is southeast of the Arbona. The property is developed by a crosscut tunnel from Mormon creek, which is now in 395 feet, and the vein is looked for with every shot. The tunnel will cut the vein 250 feet deep. The vein crops 30 to 40 feet wide on the surface. Should the crosscut show ore of good value, a shaft will then be put down.

Equitable, formerly Arbona, J. R. Sears, superintendent: The shaft is now down 180 feet on the vein, which has widened from 8 inches to 5 feet. Mill is of ten stamps.

The Gangnere, W. G. Long, superintendent: The company is operating the Gangre and Maryatt mines and the Patterson. The shaft on the Maryatt is now down 365 feet on a vein 5 to 11 feet in width. In the Patterson a crosscut shows the vein matter to be 100 to 200 feet in width. It is Mr. Long's intention to operate this mine by open cuts, quarrying the ore. On the Maryatt a 40-stamp mill is in course of erection by Mr. R. L. Chase, the millwright of Sutter Creek. The frame is very heavy and the work throughout first-class.

The Bell, George Blake, superintendent: The shaft is now down 300 feet and sinking. The walls are here 100 feet apart and the vein matter in Amador slate walls. Like the mines of Amador, the ore here is above the average of the lode.

Norwegian, Frank Enzensperger, superintendent: The mine was formerly best known as the Lawson mine. The ore showing in this mine was so very rich in heavy visible gold that the mine went begging for a customer for a long time, simply because the experts condemned it as a pocket mine. The shaft is now down 275 feet on the Norwegian vein, which is 12 to 18 inches wide. A crosscut is now being driven east 40 feet to cut vein No. 1, which is 16 inches wide, and will then be continued to No. 2, 62 feet east, which crops 5 feet wide. The ore of this mine is unlike that of any other mine on the lode in Tuolumne, being largely sulphurets, with galena and tellurium showing freely, and a sprinkling of free gold. The mill is of two stamps, triple discharge, and is intended to prospect the mine and work the ores taken out in the course of development. A 20-stamp mill will be erected in the spring. The ore carries an average of 7 per cent of $230 sulphurets, while the average value of the ore in the vein opened is $30 a ton. At the time of my visit an additional vein was just coming in in the face and showing the same rich character of ore.

In Tuolumne mines have advanced very rapidly in values. There are still a number of promising locations for sale in the county, but the operator must now expect to pay for his delay in not getting in when Tuolumne's mines were all called "pocket mines."

E. H. SCHAEFFLE.

Murphys, Cal., Nov. 25th, '97.

The thirty mills have 427 stamps, of which 140 are idle.

At the North Star and Black Warrior Consolidated mines, near Sonora, a 35-foot ledge is reported uncovered, showing abundant free gold.

Democrat: The Santa Ysabel has opened a good ore body on the 300. Drifting on the Knox & Boyle vein in No. 5 level of No. 3 shaft is opening good ore also. An electric pump is being placed in No. 1 shaft to sink 200 feet deeper. Ten stamps have been dropping whenever water for the batteries could be obtained.

Bottini Bros., who own the property two miles east of Sonora called the Potato Ranch, have developed a ledge which the Sonora *Democrat* thinks will prove one of the biggest bullion producers in the county. A shaft has been driven 120 feet, the ledge in the bottom being 7 feet of well-defined quartz, spangled with gold. The vein shows ore that will mill up in the thousands.

Jamestown *Magnet:* The Sierra Railway Company has announced a special rate on ores, concentrates and sulphurets from Chinese and Jamestown to San Francisco or the Selby works, of $4.70 per ton of 2000 pounds in carload lots of 24,000 pounds, where the value is not over $100 per ton. For ores, concentrates and sulphurets valued at over $100, but not more than $300 per ton, the rate is $5.04 per ton between the points named.

Ventura.

T. J. Harris, on Frazier mountain, has a 2-stamp mill crushing. Twelve tons produced 16¾ ounces. Mr. Harris says he has in sight 100 tons.

Yuba.

There are six men said to be at work east of Timbuctoo, under direction of H. Vischer, of the U. S. Debris Commission, surveying and taking measurements near Dear Creek narrows of the Yuba river.

NEVADA.

J. R. Church, a mining engineer from New York, is at Kennedy inspecting mines.

OREGON.

Ashland *Record:* Parham & Van Nane shut down their mill at the Braden mine last week to clean up and put in a new pump.

Oliver Jillson is erecting a 5-stamp mill on his mine near Henley.

J. C. Petters, of San Francisco, is developing the Old Coil mine.

C. D. Crane shipped ten tons of rock from the Oro Fino mine in southern Oregon to the Ashland smelter, and received a gold brick worth $515.

WASHINGTON.

A Colville report states that the Wells Fargo Mining Company has sold 30,000 shares of the treasury stock to push the 150-foot tunnel. The mine is twelve miles west from Springdale.

The Comstock Coal Company incorporated last week: W. L. Ziegiviel, M. Abel, W. Dougless, H. M. Williams, M. F. Mendenhall; capital stock $600,000. The company has a coal claim of 600 acres on which a 6-foot vein of coal has been uncovered.

The Enterprise mine on Ten-Mile creek near New Denver resumed work after two months idleness. Supt. Neal, with twenty men, went down from New Denver on Thursday's boat and fifty others have followed since.

Tacoma reports that the sale of the Lambert-Post group of five claims on Bear mountain, Whatcom county, is closed, H. Stanislawsky, representing Portland men, paying $5000 cash and $95,000 in one year from date of sale, the purchasers to have the privilege of developing the property without limit. Stanislawsky will be in charge, with headquarters at Whatcom. A stamp mill is to be built.

BRITISH COLUMBIA.

(Special Correspondence).—*The Coast:* The bond on the Lynn creek properties, close to Vancouver, has been thrown up. The ore is found to contain too much zinc to be profitably worked. This is not the case, however, with copper-gold properties on Taxada island and Phillips Arm, situated several miles north of Vancouver. Mining companies operating in these sections have shipped thousands of tons of ore as far away as Swansea, and with fair results.

The contention is held by many mining men here that United States smelters, while handling silver-lead ore to advantage, do not make the most of copper-gold ore, and the result is that copper-gold companies are making special efforts to have a smelter established here under the management of the Vivians of Swansea. These big metal people have intimated that if encouraged they may build a smelter and refinery here, but they ask for important concessions in freights, etc., from the Canadian Pacific Railway, and certain privileges from the city.

Fire Mountain Camp, Westminster District: The weather is very bad here, the snow deep and soft, and the heavy rains somewhat destructive to construction work, but the enthusiasm of the mining companies is overcoming all obstacles. The Jubilee Syndicate are getting their twenty claims in shape for development. They have arranged to buy out the charter of another company who are retiring from business. Enough money has been secured by the sale of syndicate shares at $100 each to place the combination in a solid financial condition.

Fairview Camp, Okanogan District: The Winchester Mining Company are studying the plans of a bigger stamp mill than any yet erected in British Columbia, and to this end are placing the rest of their treasury stock—50,000—on the market at 5 cents advance—30 cents. Besides the Winchester group they have a very large free milling claim known as the Stemwinder. The mill is to be erected on the edge of a natural lake, and water power will be ample.

The Comstock-Mammoth Company are sinking on the vein in their Mammoth claims and have proved up a large body of free milling ore on their Comstock property. The Comstock-Mammoth Company and the Fairview Consolidated Company are to combine in the erection of a 60-stamp mill. The Consolidated Company are selling their treasury stock at $1 a share very readily, mostly in England, and the seventeen claims of the company are to be at once actively developed.

In ten more days, or in less than a week after this statement is in print, the Tin Horn mine will have had their thirty-day cleanup and the statement will have been given to the stockholders in the States and eastern Canada. For the first fifteen days poor ore was purposely run through the mill, but for the last fifteen days a better class of ore was handled. This stock had a career on the market, having advanced from 25 to 80 cents in sixty days.

The Fire Mountain Company are still very busy on their mill. They claim that they will be in full running order by the first of January. They have been delayed by the difficult task of getting machinery up to an altitude of 7000 feet above the sea and establishing the mill on the steep side of a mountain. The ore still looks well and assays high. The work on the vein to date has proved up enough ore to last for several years.

Cayoosh Creek Camp, Lillooet District: The Golden Cache mill will clean up on the 3rd of December after a thirty-days' run. This stock is held all over the American continent and in England. It went begging at one time for 16 cents, but through a peculiar combination of fortunate circumstances for the company a craze to possess Golden Cache stock took possession of the public, and the fact that fabulously rich specimens of huge size were placed on exhibition further stimulated the demand, and the stock rapidly rose to $2.10 before an ounce was crushed. The stock is still quoted at $1.60, but will be very seriously affected by the cleanup, which will have taken place about the time this is in print.

In a measure the fate of the Excelsior mine is wrapped up in the results obtained from the Golden Cache's run. The Excelsior Company's claim adjoins the Golden Cache. The formation, quality and extent of the mineral in place is strikingly the same, and the same enormously rich assays are being obtained, while the stock of the Excelsior jumped 20 cents the first fifteen days it was placed on the market.

A. E. GOODMAN.

Vancouver, B. C.

J. B. Hobson, manager Cariboo Hydraulic Mining Company, under date of the 11th ult., states that operations have been suspended for the season and the final cleanup made, which amounted to 330 ounces, of the estimated value of $5707. The gold brick was shipped from the mine on the 12th ult. to San Francisco. The total yield for the season just closed amounted to $139,000. It is proposed to construct a new ditch, of a length of 7¾ miles, in time for next season's operations, and then no difficulty regarding water will be experienced. The Horsefly Hydraulic Company's works were closed down for the season about six weeks ago.

The result of a smelter test of twenty tons of ore from the Dundee at Ymir shows a profit of $12 per ton.

J. A. Harrington of Rossland has purchased the R. J. C. and Novak claims on Kettle river for $25,000.

The smelter returns of the Le Roi show that the ore from that mine is averaging 1.54 ounces in gold, about four per cent copper and in the neighborhood of three ounces in silver, making a total value of about $40.

Nelson *Miner:* The R. J. C. and Novak claims on Kettle river have been purchased by J. A. Harrington for $25,000, 25 per cent cash and the balance in payments. A 5-stamp mill is to be erected and in operation by July 1, 1898. Assays of ore run from $40 to $540 in gold. Work on a 75-foot tunnel is to be started at once.

THE KLONDIKE.

Observations of temperature in the Klondike were made daily by L. N. McQuesten of the Alaska Commercial Company and cover the winter of 1880-81. He reports that the Yukon froze over during the night of Nov. 2 and the ice was not broken until the 14th of May following. On the 17th of May it commenced to run and on the 23d he was able to start for St. Michaels, sixty miles away. The usual date for the ice to begin to break varies between May 31th and July 1st; June 10th is about the average. Commencing with the long nights of October the temperature sunk rapidly, and on Dec. 20th the thermometer touched 67° below zero. This intense cold lasted until the 1st of March, when the effect of the returning sun became evident.

At Dawson City flour is selling at $100 per sack and is difficult to be obtained. Fort Yukon, 400 miles below, is an Indian village, a store and six log cabins. The nearest settlement is Circle City, eighty miles up the river. The country between the two places is such that experienced Indian guides are lost. The steamer Weare reached Circle City about the last of September with 210 tons of provisions. The miners "held up" the boat with rifles, and, after inspecting the cargo, took from her about thirty tons. When the boat reached Dawson she unloaded 180 tons of supplies and returned to St. Michaels with passengers to her utmost capacity. The Weare was expected to make one more trip this winter to Dawson from St. Michaels laden with provisions. When the steamer Bella reached Circle City a few days ago she was also "held up," the miners paying for what they carried from the boat.

Men live in cabins at Dawson without windows. Glass cannot be had. Candles sold as high as $70 per box, or $1 a piece. Among the many at Dawson there is a large number classified as "riffraff," and they add to the seriousness of the situation.

Scarcity of provisions impedes prospecting for the present, but confidence in the richness of the field is not lessened by residents.

In the latter part of September a rush took place to Deadwood creek, which empties into the Yukon three miles below Dawson. The men claim that the rush was justified, and none are anxious to sell their claims.

The storing of food supplies at Fort Yukon and Fort Hamlin brings miners back to Birch creek and other diggings above Circle City, which were considered rich before the Klondike discoveries, but were abandoned for the new localities.

A letter to the Alaska Commercial Co. from Asst. Supt. J. E. Hansen at Dawson, dated Oct. 18th, received last Wednesday, estimates supplies at Dawson sufficient to sustain 3500 persons until the opening of the season next year. He advised as many men to leave as could get away from Dawson; and, following his advice, about 500 departed, some going down the river to Fort Yukon and others going out by the way of the passes to Dyea. According to the figures given to the company by Mr. Hansen, there will still remain in Dawson 4500 persons, while the supplies are only sufficient to subsist 3500.

The fact that Mr. Hansen counseled everybody that could get away to leave Dawson City as speedily as possible shows that he regarded the situation as critical.

Hansen confirms the story that flour is selling at from $2 to $3 per pound. The selling is confined to individual swappings. The company has no provisions to sell. When Hansen wrote, everything had been sold.

Supt. Hansen spent twenty-one days poling up the river from Ft. Yukon to Dawson, 400 miles.

Writing from Dawson City, M. B. Thompson of Seattle says: "I believe this will be the last year the country will be any good. Next year there will be such an awful crowd here that a man without a claim will be worse off than in Seattle. There are not over 250 good claims in the district, so far as known. There are about 3000 men working here in the mines now. Unless there are more rich strikes found newcomers will simply be disappointed."

UTAH.

Manager Dern of the Mercur mine reports the third chute of ore recently encountered 39 feet of excellent leaching material, and the footwall has not been encountered. The showing is one of the most remarkable in the diggings. This is the bonanza for which a London syndicate offered $1,000,000 spot cash.

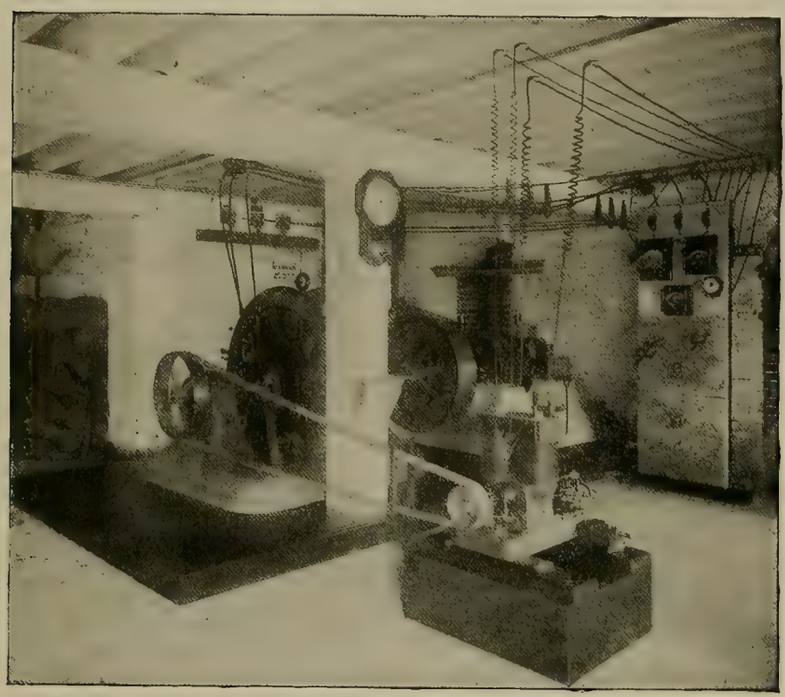
The Bullion-Beck at Eureka resumed operations last Wednesday. One hundred men, who have been idle since last October, will again have work.

(Continued on page 530.)

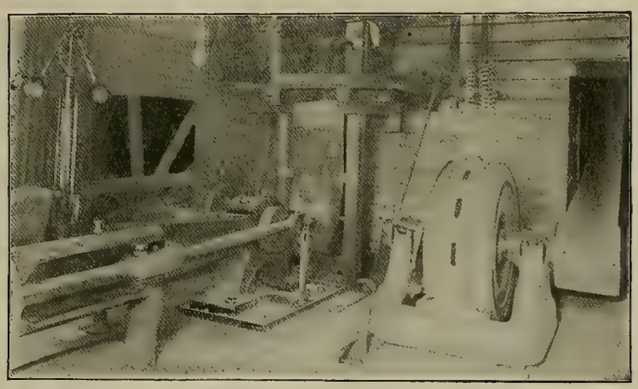
Electrical Progress.

Electric Progress on the Pacific Coast.

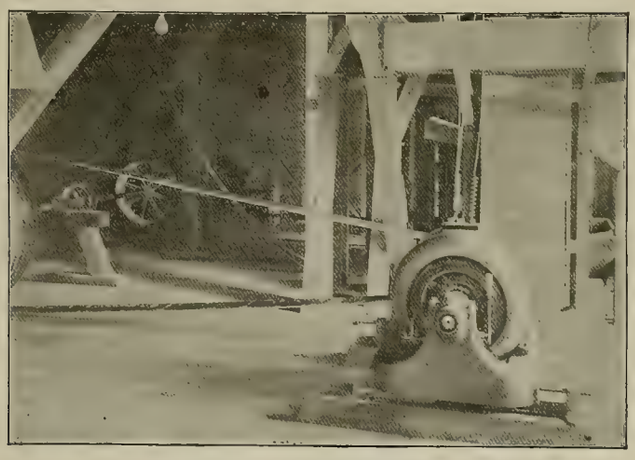
Since the completion of the three-phase electric power transmissions on the Pacific coast, between Folsom and Sacramento and the San Joaquin and Fresno, the use of electricity as a motive power has made great strides. Two of the most important flour mills are now added to the list of consumers. The first to place its dependence on electric motors was the Sperry Flour Mill of Fresno, Cal. This is driven by a General Electric synchronous motor of 150 kilowatt capacity running at 600 revolutions. The illustration shows this motor with a small bipolar motor to bring it up to speed, in the basement of the mill, whence the main belt passes to the rolling and grinding machinery above. The second mill is the largest flour mill in the United States using electricity instead of steam. Its electrical equipment consists of three General Electric three-phase alternating current induction motors operating at a pressure of 500 volts. The largest of the three motors has a capacity of 75 H. P. This is belted to the main shaft of the mill and drives all the flour-making machinery. It runs continuously for twenty-four hours and for three months without stop. The second largest motor is one of 30 H. P. This occupies a position on the second floor of the mill and drives all the cleaning machinery. It runs continuously for eighteen hours daily. The third is a 20 H. P. motor, and is placed in the basement near the 75 H. P. motor. This drives the roll for grinding the corn and the barley. Its work is intermittent and it runs from eight to ten hours per day only.



150 K. W., G. E. SYNCHRONOUS MOTOR IN SPERRY FLOUR MILL.



75 H. P., G. E. INDUCTION MOTOR, DRIVING FLOUR MAKING MACHINERY IN PHŒNIX FLOUR MILL.



30 H. P., G. E. INDUCTION MOTOR, DRIVING ALL THE CLEANING MACHINERY, PHŒNIX FLOUR MILL.

The power consumed by the motors is registered by means of recording meters which show the total horse power of current consumed. These meters register exactly the power used and allow the company to keep a careful watch upon their machinery and obtain the highest economy in operation. For instance, when the cleaning for the day is completed, and the 30 H. P. motor and all the cleaning machinery are shut down, all expenses for power in that department cease at once. No power is wasted in running idle shafting and belting. The same is true in a still greater degree in the corn and barley crushing department where the work is more intermittent.

In addition to the economy in the operation of the mill space has been saved. The present capacity of the Phœnix mill is 275 barrels of flour and 20 tons of rolled barley and feed every twenty-four hours, and the entire output of this mill is taken by local consumption, none of the product being shipped outside the State.

THE most powerful electric lighthouse in the world is at Penmarch Point, Brittany—the Eckmuhl. This light is to have an illuminating power of 3,600,000 Carcel burners or of 36,000,000 candle power, and will flash regularly at intervals of five seconds. The flashes will be projected from two lenses coupled together, each consisting of four separate pieces. They will be mounted upon a solid platform which rests in a trough of mercury and will revolve around a vertical shaft. It will take twenty seconds to effect one revolution. This will be accomplished by means of a clockwork mechanism driven by weights. In each of these lenses will be located an arc light provided with carbons of ten and sixteen millimeters diameter, thus enabling a large or small amount of current to be used. Alternating currents will be employed of 25 to 50 amperes at a pressure of 45 volts. They will be generated by two two-phase alternators. During clear weather it is only proposed to run one of the generators supplying current to the smaller carbons. In times of heavy fog both alternators will be set going and together will supply a current of 50 amperes to each of the 16-millimeter carbons.

A CO-OPERATIVE electric pumping plant has been put in operation at Arlington, near Riverside, Cal. The water flows by gravitation from the canal to the pump in an eight-inch pipe. From this point it is forced through a six-inch pipe to a point eighty feet above the level of the canal, and in a four-inch pipe to a point 100 feet above the canal. The machinery works perfectly, and the water flows into a flume at a fifty-foot level as steadily as if by gravitation. The plant consists of a 20 H. P. electric motor and a No. 7 screw pump. It will pump water enough to irrigate 200 acres. The cost of land and water above the canal is $12 more per acre than below the canal with $2.50 per year per acre added for operating the plant, which is now watering eighty-nine acres of fruit trees. The success of this experiment demonstrates what can be done in the way of irrigating foothill lands by electricity.

Mechanical Progress.

Regenerating Burnt Steel Tools.

Steel when heated too highly during glowing, hardening or welding passes into a condition in which it is usually called burnt steel. Such steel has suffered a remarkable change in its structure, the fracture surface showing according to the intensity of burning a more or less large, coarse grain of white luster. This grain is called in practice an open grain, because the single crystals are grouped so far apart as to be plainly distinguishable by the naked eye. By examining the fracture surface with a hardened needle it will be found that soft and very hard spots alternate with each other. It is well known that steel when in such a condition is of no practical use. By exposing steel for a longer time to too high a heat, with unobstructed access of air, the so-called dry welding heat, a gradual diminution of the carbon contents is caused, so that it is finally transformed to wrought iron, thus losing its hardening quality altogether. But if steel has occasion to absorb large quantities of carbon during heating, it changes to cast iron. These changes of steel regarding its carbon contents are of a chemical nature, and can be remedied by suitable treatment—by carbonization or decarbonization.

There are several means for doing this, says an article in the *Werkmeister Zeitung*, translated for the *American Manufacturer*. The so-called regeneration of burnt steel is most simply accomplished in the following manner: Heat the steel several times to a dark red, and quench after each heating in hot water. The steel finally recovers its former qualities. The first heating and quenching has the strongest effect, which gradually becomes weaker until after the fourth or fifth treatment the steel is affected no longer. From this it is evident that three or four temperings are usually sufficient. By examining the fracture surface of steel thus regenerated it will be found that its grain has become as fine as it was before burning; in fact, its structure is identical with that of similar steel hardened, but which had not suffered any previous burning. It is, however, always to be understood that the above mentioned chemical change of the steel in regard to its carbon contents has not taken place simultaneously with its burning. In this case the simple tempering method is of no avail, and the steel has to be subjected to a different treatment, according to the circumstances. If the steel has absorbed too much carbon, it should be heated slowly, allowing free access of air; if it has lost too much carbon, it has to be recarbonized before hardening. This is accomplished by putting the tools or other steel articles to be treated into boxes of sheet iron or crucibles and imbedding them either singly or collectively in powdered bone or charcoal. After the boxes or crucibles have been closed tightly, these, together with the contents, are heated for about one hour, when the articles are taken out and tempered in water. Frequently heating in closed vessels is dispensed with, and simple hardening means applied to the articles. In this case, for instance, ferrocyanide of potash can be sprinkled on the articles after they have been heated to a brown red, and they are then tempered in water.

A number of means for regenerating burnt steel are in use, and either one or the other is recommended by their respective champions. Some favor pure water, but others prefer stronger mixtures. Two recipes are given:

1. 10 parts of resin.
   5 parts of fish oil.
   3 parts of mutton fat.

When employing this mixture the steel is heated to a dark red and quenched in the molten liquid, after which it can be tempered in the usual manner.

2. 10 parts of mutton fat.
   10 parts of linseed oil.
   1 part of lamp black.

This mixture is melted and the

heated steel dipped into it for one minute.

Hydraulic Power.

The use of water under a high pressure imparted to it either from the fact of its source being at a high elevation as compared with the level where it is used, or by power derived from any other source, applied through some kind of pumping mechanism, in some respects, is the most simple and effective agent for transmitting power, and the most easily applied, where the application can be direct, for a great many of the purposes for which great concentrated power under absolute control is required.

I have a conviction, based upon my own experience, that water under high pressure, as an agent for the transmission of power, has latent possibilities yet to be developed, that will bring it into a more extended application as these possibilities become better understood.

It has not the capacity to produce the brilliant effects that are so readily obtained from electric power transmissions, but as a steady, faithful and reliable servant, it outranks, in my opinion, any of the newer agents for the transmission of power, when applied to any of the varied purposes that favor the conditions under which water must always be used, and, I am confident, that the field in engineering for the application of hydraulic power will become wider and more productive as engineers become better acquainted with the possibilities of its cultivation.

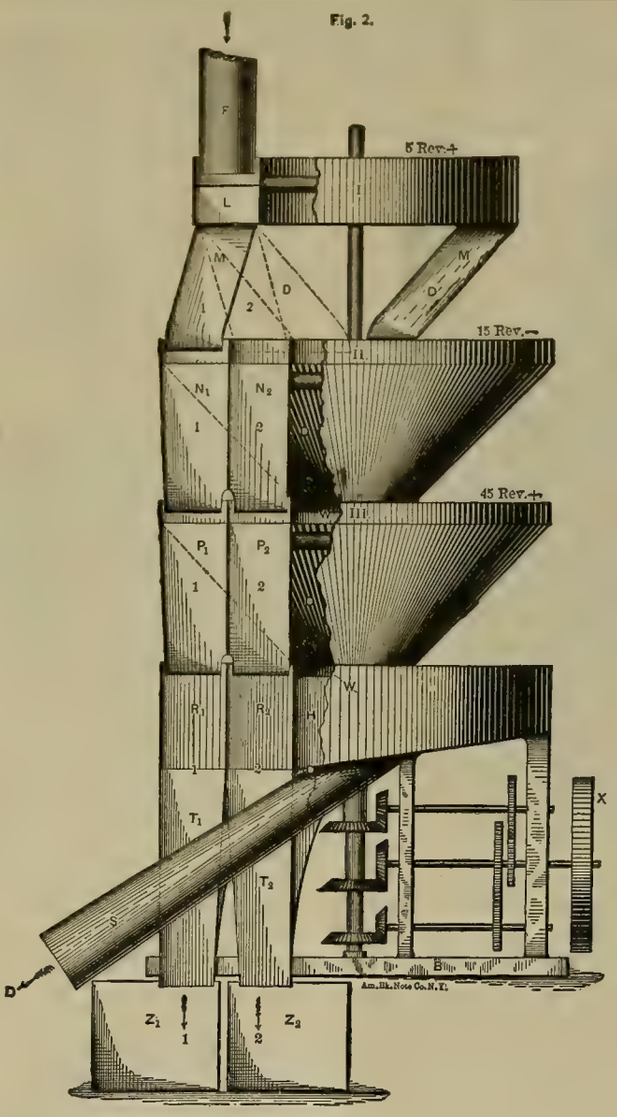
For the permanent source of power for a hydraulic plant I would never think of using ordinary, direct steam pumps, even if the steam cylinders are compound. The simplest form of pump, and the most effective, is a three-throw crank shaft operating three single-acting plunger pumps, with the pump valve area sufficiently large to admit of about 160 feet per minute speed of the plunger, with not more than 2½ per cent more pressure in the pump barrel than that in the accumulator. From 1,200 to 1,500 pounds per square inch is, in my experience, the best pressure to use for general purposes. It suits the ordinary extra strong, lap-welded pipe in the market. Hemp packing will give no trouble in stuffing boxes at that pressure. Ordinary fairly sound castings of brass or iron will stand the pressure indefinitely. At pressures much higher than that stated, castings, unless of steel, and these are hard to get sound, begin to fail on the inner surface by developing small cracks that gradually deepen until they reach a point where the solid metal outside of them will not sustain he load.

In cast iron or brass more than three or four inches thick, the outer portion of the metal does not appear to take its proportion of the load, and destruction works from the inside outward.—Geo. W. Dickie in Cassier's Magazine.

Solid Petroleum Fuel.

DURING the past few years specimens of solid petroleum fuel have been exhibited in Los Angeles, says the *Times*, but there has generally been some drawback to them, and they have not come into general consumption. A new fuel of this kind has just been invented by G. H. Fullerton. By the use of certain chemicals and peculiar treatment of the crude petroleum he makes a black solid mass, which in some forms breaks almost with a fracture. It burns as coal burns, does not fuse or run, without so much smoke as ordinary coal, costs at present price of oil less than $5 a ton, and gives out between two and three times the heat units that the same weight of coal will give. The material may be made into any form of brick, is much cleaner than coal in handling, has comparatively little of the petroleum odor; it can be stored in the sun without fusing or melting, and in other ways is a marked advance in the preparation of fuel materials for use.

Fig. 2.



MECHANICAL ORE SAMPLER.—(*See page 521.*)

Scientific Progress.

The Zerograph.

The zerograph is a direct printing telegraph machine, having keys operated like an ordinary typewriter. It is claimed that the faults inseparable from those instruments operated by the step by step system are avoided, and that, instead of short distances, very long distances—at least up to 500 miles—can be worked over with ease at very rapid rates. The zerograph is entirely automatic in its mechanism and synchronism, and it requires no attendance when messages are received. Messages are given in duplicate; that is to say, the message is printed at each respective apparatus, each acting in turn as transmitter and receiver. It has no type wheel and no clockwork, as hitherto chiefly employed, nor does it work by a series of intermittent currents, set apart for each letter or character to be recorded. One improvement is in the construction of a mechanism with an electro-magnetic arrangement, employed to produce a motion, and necessitating only two intermittent currents or impulses for each letter or character to be recorded. The first current starts the synchronous motion and the second current arrests the same at the proper letter. All other necessary mechanical actions are brought about through a system of electro-magnets and by a local source of electricity. A second improvement is in the construction of the electro-magnetic, and also in the mechanical arrangements employed to produce the motion necessary for printing in columns, and the automatic control of the same.

In each apparatus a series of finger keys are employed as in a typewriter, with which keys are connected spring pins, arranged in the arc of a circle. The center of this circle is the axis of an arm, which is termed the synchronizing arm, and which is adapted to be swung by an adjustable weight above the spring pins until arrested by any one pin moved into its path by a finger key. The spindle on which the synchronizing arm is mounted carries a governor or loose weight actuated in one direction only by a pawl connected to the spindle, which weight determines the speed of the arm. The spindle also carries a series of spring types arranged in the arc of a circle and corresponding with the finger keys, a plunger being employed to move each type when in position against a roll of paper upon a carriage; a suitable inking device, such as an ink ribbon, being employed for gaining a face impression. The synchronizing arm also carries two projections adapted to be moved by the armature of the synchronizing magnet, one of which is designed to be projected between the spring pins, while the other is engaged by a hook on the armature of an electro-magnet, so as to hold the arms in its initial or zero position. This magnet, which is termed the starting magnet, is energized by the first electric impulse or current produced by the closing of a local electric circuit when a finger key is depressed; the armature in its movement also closes the line circuit connected with the synchronizing magnet at a distant or receiving apparatus, which magnet attracts its armature and withdraws the projection on the synchronizing arm engaged with the hook of its starting magnet. Both synchronizing arms are thus released simultaneously, and, being similarly constructed and adjusted, move at the same speed. The synchronizing arm of the transmitting apparatus then makes contact with the projecting spring pin, operated by the finger key, thus closing another local circuit and energizing an electro-magnet, which is termed the second contact magnet, the armature of which in its movement again closes the line circuit through a contact screw, and produces the second electric impulse or current. This current again energizes the synchronizing magnet of the distant or receiving apparatus, the armature of which moves the other projection so as to stop the synchronizing arm against the spring pin corresponding with that operated by the finger key in the transmitting apparatus, and thus closes a local circuit as in the transmitting apparatus. These local circuits in both apparatus then operate each simultaneously an electro-magnet, which is termed the printing magnet, and which operates the plunger and causes the type to print, to feed the carriage along, carry the paper roll, and close another local circuit, on which circuit is an electro-magnet which is termed the zero magnet, and which is energized to return the synchronizing arm to the zero position. To feed the paper on its roller so as to start a fresh line or column, another electro-magnet is provided, which is termed the column magnet, which is energized by allowing the synchronizing arm to travel farther than the row of spring pins extend, where it is stopped by a fixed pin (which is in the same local circuit as the spring pins), and also causes a contact to close the circuit containing this magnet.

Mystery of the Sun.

Well might McPherson's ancient and half mythical Gaelic poet, speaking, eighteen hundred years ago, from the mists of his stormy hills, wonder at and rejoice in the sun. Nor has Ossian's early question ever yet been answered: "Whence are thy beams, O sun! thy everlasting light?" Modern science has wrought damaging discussions about the reality of the alleged "miracles," and done much to establish the universal reign of inviolable law; but of all miracles, what greater one is there than the calm persistence, through so many millions of years, of this unfailing fount of light and warmth? We no longer deny or question the doctrine of Kant and La Place concerning the origin of our family of planets—for science admits the truth of the conclusion that, one after another, but at vast ages apart, they were thrown off from the sun—once a nebulous object filling all the space to the farthest verge of Neptune's orbit (and perhaps farther), and then a slowly condensing body, from which the planet Mercury, or possibly a still nearer one to the sun, was the last to be thrown off, each and all obeying the omnipotent magnetic law that compels every planet to circle around the parent orb—the controlling center ever keeping, like an earthly parent, his youngest child nearest to him.

THE practicability of transmitting a long distance a given amount of steam is illustrated in an account recently given by Mr. Coxe before the Society of Mechanical Engineers. At a colliery it was desired to carry steam to a water works about 4500 feet over a hill from the boiler plant. To do this a trough was made by nailing the edges of two boards together, so that they formed a right angle, the trough being supported by two stakes driven in the ground and crossing just beneath the trough; the pipe was laid in the trough, resting on cast-iron plates, the pipe surrounded by mineral wool, and a similar inverted trough placed at the top. To allow expansion a bend was made to one side at the top of the hill, and then it was turned back to its original direction; a large receiver was introduced in the pipe at the pumps, made of three boiler sheets, and having a diameter of 34 inches, and serving also as a separator. As the elevation was some 1800 feet above the sea excessive cold was experienced in the winter time, the arrangements, however, fulfilling the desired purpose, costing nothing for maintenance and giving no trouble.

Mining Summary.

(Continued from page 527.)

IDAHO.

A Murray dispatch says: The season for prospecting has ended in the Cœur d'Alenes, and a few more locations will be recorded until after the coming of the new year, when the usual number of properties on which assessment work was not done will be jumped.

MONTANA.

Manager Thofehrn, of the Manhattan and Montana properties, in Granite county, has gone to London, where capitalists have agreed to purchase a large block of the stock company to develop the mines.

The October report of the Consolidated Tiger-Poorman Co. shows a net profit for the month of $12,327.48.

The Pardee mine, on Rock creek, Grants county, twenty-five miles from Philipsburg, is to be provided with a 10-stamp mill. This property is owned by County Treasurer Pardee of Granite county, and his son. It is a medium grade gold quartz, assays of the ore running from $8 to $17 per ton.

WYOMING.

Douglas & Adams, in the Northern Belle mine, Sandstone mining district, fifteen miles west of Grand Encampment, are erecting a 10-stamp mill, with power for twenty stamps, and expect to have the plant in operation January 1st, '98. A general average assay of Northern Belle ore shows $66 to the ton.

MISSOURI.

At Joplin last month $24 per ton was paid for zinc ore in the bin.

Lead ore declined $1 on the 1000 pounds and sold at $32 per 1000 pounds in the bin. For the corresponding week of last year lead ore brought $15 per 1000 pounds, and the best grade of zinc ore $24.50 per ton.

COLORADO.

Were it not that it is positive of the truth of the statement, the *Telegraph* would hesitate before publishing the report that any mine, much less any lease, in Cripple Creek, had produced ore to the amount of $37,000 net in a single week. This was the production of the Johnson lease on block 1 of the Half Moon claim, belonging to the Matoa Company. Last week the Johnson lease shipped thirty-four cars of ore to the smelters, and this week word was received at the company's office from their agent with the ore at the smelters, that the shipments would bring net returns of $37,000. This ore ran from 3.4 ounces to 6.6 ounces, the larger amount being at the latter figure.

The Enterprise, at Rico, employs seventy-five men and a number of leasers. The Enterprise and Rico-Aspen ores run about an ounce in gold to every hundred ounces in silver, and even at the present price of silver yield a profit.

K. Benson sold his Terrible and Butterfly properties near Ophir to the A. C. G. S. of London, for the sum of $190,000; $25,000 has been paid.

Wabash, Ind., men are developing the Gettysburg mine in Gilpin county.

The output of the Nevadaville properties on Quartz hill, operated by the Gold Coin M. Co. for the past month reached a total of $23,000.

The New York and Indiana G. M. Co. is building a shaft-house on the Star of the West property, Lake district. A force of men is drifting and stoping in the east 165-foot level, taking out a fair grade of smelting ore.

The Orizaba Leasing Co. sent out fifty tons of mill ore from Victor. The Beacon hill chute has proven continuous to the depth of 140 feet.

The Marinette Co., Cripple Creek, is producing twelve tons smelting ore daily.

A Victor dispatch of the 1st inst. says the total tonnage for November shows an increase of about 3000 tons; 1000 in mill ores and 2000 in higher grades treated with the smelter.

NEW MEXICO.

The Lone Star group, Cochiti district, comprising six claims, was sold recently to McFarland & Greenwood.

S. H. Elkins, receiver of the New Mexico Mining Company, has given the McGee Milling & Mining Company of Summerfield, Kas., the privilege of putting a plant on the mill site connected with the Cunningham mine at Dolores, with the understanding that they would treat Cunningham ore.

The Gold Standard mine at Golden has been bought by J. A. Davis, of the Galisteo Placer company, under a $60,000 working bond.

ALABAMA.

(Special Correspondence).—The production of minerals and products manufactured therefrom in the State of Alabama during October, 1897, as reported by the producers to Dr. Eugene A. Smith, State Geologist and Secretary Ala. Ind. and Sci. Soc., are as follows: Coal, 480,416 short tons; coke, 101,615 short tons; pig iron, 73,242 long tons; iron ore, 153,044 long tons; limestone, 51,118 long tons; bauxite, 1181 long tons; silica, 140 short tons; building stone, 4500 cubic feet; total number of employes, 12 627. WM. M. BREWER.

Birmingham, Nov. 27.

ARIZONA.

Average samples of ore from the new strike on the Six Mile Hill mine assay $216 gold and fifty ounces silver.

The Jerome Copper Co. has bonded four claims in Yavapai county, increasing its territory to 160 acres. Work has begun on the tunnel to be run 2000 feet.

MEXICO.

The American-Mexican Mining Co., Sonora, Mexico, has incorporated; capital, $500,000; principal office, Kansas City; incorporators, J. Doherty, J. C. Duncan, T. H. Ijams, L. C. Friend, A. Shanklin.

A City of Mexico dispatch says: The sale of the copper mines in the State of Michoacan to Paris Rothschilds is not formally completed, but may be within a month, the price being, it is stated, more than $5,000,000.

SOUTH AFRICA.

The Rand gold output in October was 274,175 ounces, an increase of 74,286 ounces over 1896.

Coast Industrial Notes.

—Inyo Co., Cal., has marble sufficient in quality and quantity for the new San Francisco postoffice, all statements to the contrary notwithstanding.

—Fifteen vessels are reported to have left the Atlantic coast in the last few weeks for Alaska. All of them have arranged to call at San Francisco to complete their outfits.

—General Manager Bancroft of the Oregon Short Line has contracted with the Illinois Steel Co. for 15,000 tons of No. 18 70-pound steel rails, delivery in January and February next, with the privilege of making the order 35,000 tons.

—Nearly 3000 men are employed at the Union Iron Works of San Francisco building ships. The battleship Wisconsin is on the ways at the Potrero works. Her length is 368 feet; beam, 72 ft. 6 in.; tonnage, 11,500 tons. Next month the new Japanese cruiser Chitose will be launched.

—President Kerr of the Manufacturers' and Producers' Association proposes to find out if the law permits the California State Prison Commissioners to conceal their official acts from the public, and, incidentally, if that body can evade the plain mandate in purchasing coal, etc.

—A. S. Hallidie, president of the California Wire Works, Philip Rowe and other San Franciscans are developing the coal properties at Coal Harbor, Quatsino sound, B. C., recently illustrated and described in this paper, and expect to produce shipping coal in commercial quantities next year.

—The Los Angeles oil producers' trustees have received their first storage tank. Another will be ordered at once; the two will give a total storage capacity of 70,000 barrels. The oil wells that have been closed down have resumed operations to-day. The Santa Fe Railroad Company is consuming nearly 900 barrels of oil daily, and the Southern Pacific about half as much.

—It is calculated that it will take 500 days to put through the Rodeo tunnel of the San Joaquin and S. F. railroad. During its construction the main line from Stockton to the eastern end of the tunnel will be built and the wharves, depots and warehouses at Point Richmond will also be constructed. It is expected that the entire ferry system will be in operation by that time.

—The El Dorado Light & Power Company proposes to manufacture and produce electric light, power and heat by utilizing the waters of the South Fork of the American river, Cal., in generating electricity; capital stock, $300,000; subscribed, $25,000; E. F. Smith, W. C. Hendricks, R. C. McCreary, T. A. W. Shock, J. G. Cunningham, of Sacramento. The present proposition is to exchange $100,000 of the stock for bonds.

—Turner, Finch & Campbell of Spokane, Wash., are directors in a company organized in New York city this week, capital $1,000,000, to develop the water power of the Pend d'Oreille river, near its confluence with the Columbia, and deliver electric power into Rossland, Trail and other camps of the Kootenay district. It is proposed to develop 2000 H. P. and to utilize the present works of the Goodhugh syndicate of New York, which developed 750 H. P., to work placer deposits at the south of the Pend d'Oreille.

—Port Angeles, on straits of Juan de Fuca, Washington, opposite Victoria, B. C., has raised a bonus of $75,000 in cash and lands for a tinplate manufacturing company, having its headquarters in Pittsburg, and said to own processes by which tinplates can be made cheap, to build a black sheet and finishing mill at that point. Coal of coking quality is reported "within a few miles." Iron ore is known to exist in the Olympic mountains; the new works will procure their ore from Barclay sound, Vancouver Island.

Catalogues.

CATALOGUE "A" just issued by the Vulcan Iron Works, 505 Mission St., S. F., gives full details of the Vulcan refrigerating and ice machinery made by this old-established firm. Considerable of interest and value is given concerning the different systems of artificial ice making, etc., clearly and intelligently arranged and handsomely illustrated. The pamphlet gives just the kind of information wanted by any one contemplating the use of a refrigerating or ice-making plant.

THE 1898 catalogue issued by Hendrie & Bolthoff Manufacturing Company, of Denver, Colo., is at hand and presents an excellent showing of the mining, milling and smelting machinery handled by that house. The illustrations which accompany the descriptions and price lists are of the best. The book will be in demand by that company's large number of patrons.

Personal.

C. A. MOLSON is visiting Salt Lake City, Utah.

W. E. HENDRY is now manager Northern Light, Utah, mill.

W. J. BRYAN is in Mexico, studying the financial situation.

JNO. W. MACKAY leaves for the East this week and thence to Europe.

GEO. E. AMES of the Union Iron Works has returned from a Montana trip.

C. A. HAMILTON of San Francisco will leave for Mexico about the 18th inst.

M. L. HEWETT has resigned as general manager of the G. M. M. Co. of Basin, Mont.

E. T. HALE succeeds Eugene Fechet as manager Old Glory mine, Oro Blanco, Ariz.

J. O. RUSBY is superintending operations at the Bonnie and Olga mines, Fort Scott, Cal.

W. H. THOMAS of California has gone to Bingham, Utah, to take charge of the Niagara mine.

ON the 1st inst. C. E. Nivens took charge of the Tom Boy, Colo., mine, succeeding Supt. Adsit.

THOS. B. EVERETT has returned from Denver, Colo., to Clarksville, El Dorado Co., Cal.

W. M. IRELAN has returned to San Francisco from an inspection of the Brunswick, Nev., lode.

H. W. TANGERMAN has been appointed superintendent of the American mine near Sutter Creek, Cal.

CHAS. G. YALE, who has been seriously ill with pneumonia since his return from the Yukon, is convalescent.

L. J. HANCHETT still thinks that Jno. W. Mackay and associates will buy the Blair mines at Silver Peak, Nev.

SIMEON WENBAN of San Francisco has bought the Golden Hope mine near Townsend, Mont., for $35,000 cash.

GEO. D. GREENWOOD, manager California Electrical Works of San Francisco, has returned from the Atlantic coast.

GENERAL MANAGER BUCKMINSTER of the Santa Ysabel, Cal., mine, arrived in San Francisco from Boston yesterday.

H. C. BROWN, owner of the Brown Palace Hotel, Denver, Colo., is sojourning in San Francisco, his first visit since '57.

A. P. BRAYTON SR., president Pelton Water Wheel Co., who is sojourning in Honolulu, is reported much improved in health.

W. H. THOMAS of the Niagara, Utah, M. Co., who has been examining some California properties, has returned to Utah.

D. H. JACKSON, owner of the Salisbury mine, El Dorado county, Cal., has secured a bond on the Pacific group, Placerville.

J. HARVEY succeeds H. Endey as foreman of the Zeile mine, Amador county, Cal. Mr. E. filled the position for seventeen years.

H. QUINE is the new superintendent for the English company that has secured the tailings in the Bear river near Colfax, Cal.

J. D. GRAHAM, Provincial Gold Commissioner at Revelstoke, B. C., has resigned to accept the management of the Waverley mine.

H. P. GORDON, who has been for some months superintending mining operations in Colombia, S. A., is about to return to California.

RICHARD A. PARKER, general manager of the California Exploration Company, has returned to San Francisco from Calaveras county.

A. J. BOWIE, Alf. Tregidgo and J. D. McGillivray of San Francisco reached Dawson city, N. W. T., last October. Of nearly 900 who left San Francisco for the Klondike, via St. Michaels last summer, but forty-five reached their destination.

JNO. S. WHYTE leaves Globe, Arizona, to superintend operations at Linares, Nuevo Leon, Mexico, for the American Exploration Company.

J. O. HARRON, vice president and general manager of the Parke & Lacy Company of this city, is expected to return next week from a six months' sojourn in Australia.

E. A. WILTSEE of San Francisco has bought the yacht Aggie, considered the fastest on the coast. She originally cost $25,000, and it is probable will figure in a Yukon cruise next spring.

E. W. CHAPMAN, Supt. of the Taylor mine, El Dorado county, Cal., is managing four additional properties, the Zantgraf, Channel Bend, Three Stars and Bear River Hydraulic.

R. C. READ, foreman Occidental mine, Virginia, Nev., is organizing "a dredging, transportation and mining company to operate in Alaska," and is locally credited with extensive financial backing.

H. BRATNOBER is credited with a good many enterprises "backed by the Rothschilds," as usual. The latest is the organization of a New York company to build a railroad "under Canadian auspices" from Skaguay to Dawson city.

WALDEMAR LINDGREN will take the chair of Metallurgy and Mining at Stanford University early in '98. He is at present engaged in Government work in Idaho. Mr. Lindgren has contributed considerable to this paper, his most recent article being on the mica deposits of Idaho. He is a graduate from the Freiberg School of Mines, has familiarized himself for the past fourteen years with mining and metallurgical methods of the Northwest, and is well and widely known in California.

Recent California Mining Incorporations.

McKinley M. & M. Co., San Jose, Cal.; capital stock, $100,000; $1001 subscribed; T. E. Johnson, A. Friant, J. B. Hammon, G. W. Miller, H. Postlethwaite.

Monitor M. & M. Co., Monitor; capital stock, $1,000,000; all subscribed; A. Kennedy, P. Curtz, H. F. Musser, G. C. Brandman.

Fortuna Mining Company, Fortuna, Humboldt county, Cal.: B. N. Willsie, D. R. Johnston, G. W. Snively, L. S Ash, A. H. Willsie, C. E. Bryant, M. F. Stephenson; capital stock, $1,000,000; subscribed, $1,475.

The Alaska Dg., C. D., D. Co., San Francisco; J. F. Moody, T. R. Jones, G. W. Cummings, E. F. Woodward; capital, $100,000; $500 subscribed.

Aromas M. Co., Watsonville, Cal.; capital stock, $500,000; subscribed, $150,000; J. T. Porter, A. S. Chalmers, G. H. Brewington, P. E. G. Anzar.

Recently Declared Mining Dividends.

Tamarack Copper Co., Mich., $3 per share; payable Dec. 31.

Osceola Copper Co., Mich., $1 per share; payable Dec. 31.

Utah, Utah, $1000; payable immediately.

Geyser-Marion, Utah, 3 cents per share, $9000; Dec. 1.

Morning Star mine, Cal., $6 per share; payable immediately.

Victor G. M. Co., Colo., $40,000; Dec. 1.

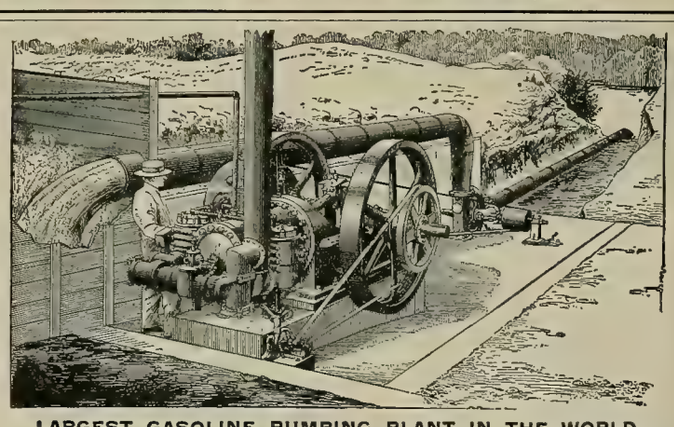
Geyser-Marion, Utah, 3 cents per share, $9000; Dec. 1.

Santa Rosalia, Mexico, M. Co., 10 cents per share; Dec. 1.

The Apollo Con. M. Co., Alaska, 50 cents per share, $100,000; Dec. 15.

Geyser-Marion, Utah, $9000; Dec. 1.

Swansea, Utah, $5000; Dec. 1.



LARGEST GASOLINE PUMPING PLANT IN THE WORLD

The illustration shows the gigantic pumping plant recently built by the Hercules Gas Engine Works on the Packer Ranch, Colusa Co. 80 h. p. Hercules Engine, pumping 7200 gallons a minute, 27 feet high. Burns Gasoline or Distillate oil. Cheapest power known. Gas, Gasoline and Oil Engines, 2 to 200 h. p. Send for Catalogue. HERCULES GAS ENGINE WORKS, 217 Bay St., San Francisco.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

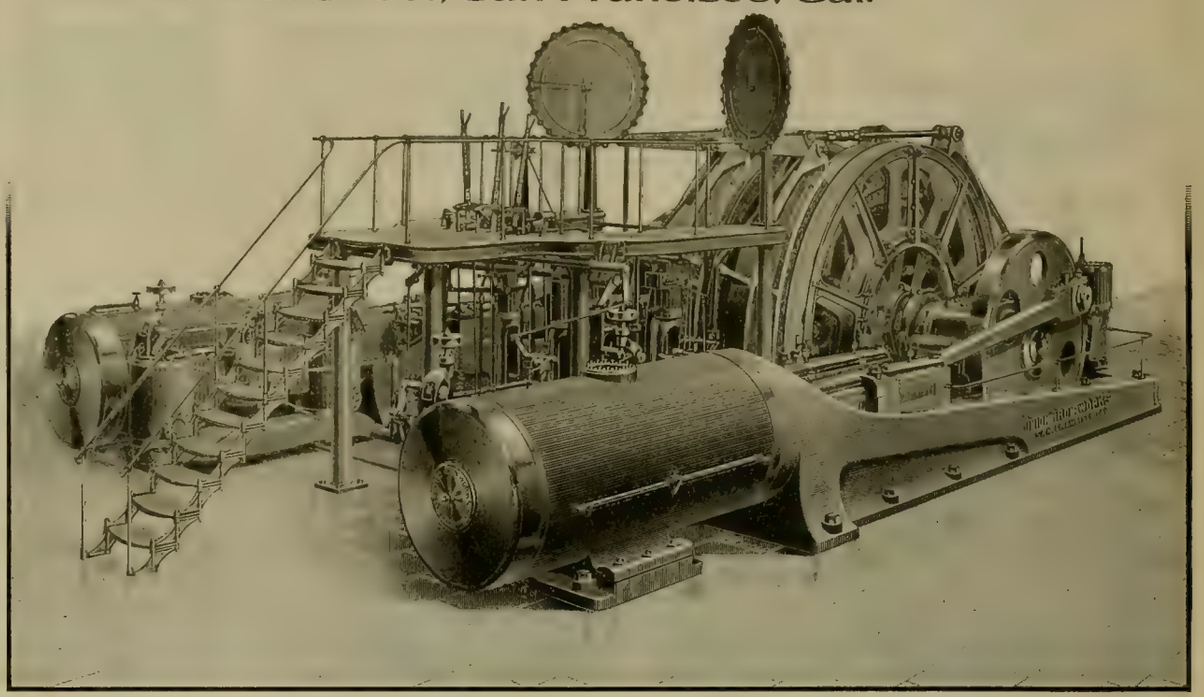
30 in. x 72 in. Direct Acting Hoisting Engine

BUILT FOR THE

Anaconda Copper Mining Company

OF MONTANA.

Embodying all that experience and practical working have demonstrated as valuable in this class of machinery.



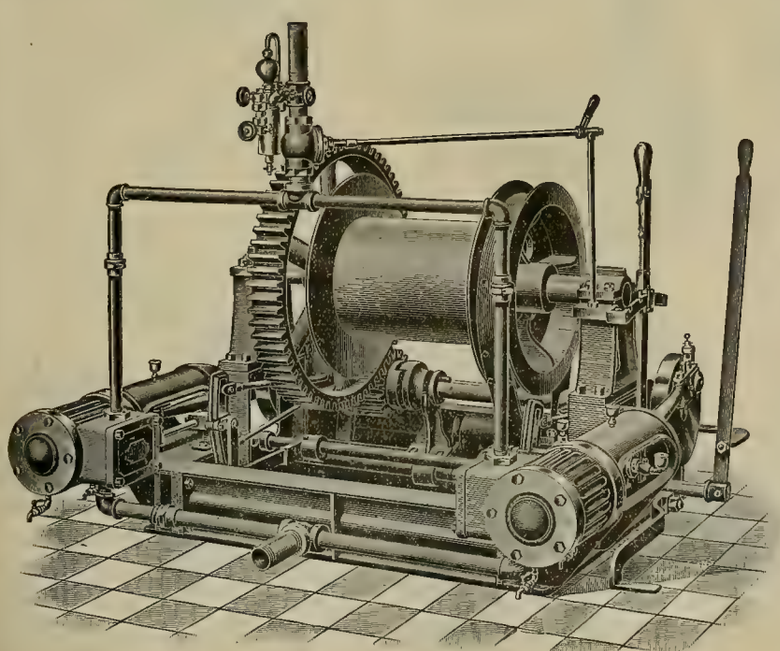
The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.

BAKER & HAMILTON,

HIGH GRADE

Engines, Boilers,

ICE MACHINES, MINING TOOLS, Etc., Etc.



THIS CUT represents one of our improved **DOUBLE STEAM HOISTING ENGINES.** We have them in sizes from 12 H. P. up (with or without boilers). They are constructed with the greatest care by engineers familiar with the best previous practice. They come with sectional iron frames, reversible link motions, etc.; consequently can be shipped knocked down, in pieces suitable for transportation over difficult roads and trails.

We also have them with the Single Engines from 6 H. P. up; Boiler and Engine contained on same frame.

These outfits are built in the most substantial manner possible, and on the most approved principles. We recommend them in every particular.

30 and 32 FREMONT ST., SAN FRANCISCO.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman o practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

DEWEY, STRONG & CO.,
PATENT SOLICITORS,
330 MARKET STREET, - SAN FRANCISCO, CAL.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.**

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

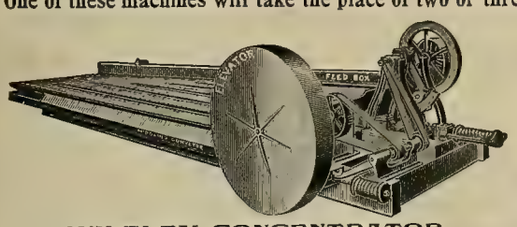
WILFLEY CONCENTRATOR.

PRICE $450 F. O. B. San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.



WILFLEY CONCENTRATOR.

SEND FOR CIRCULARS.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, barring none.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

AMALGAM PLATES.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'S Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

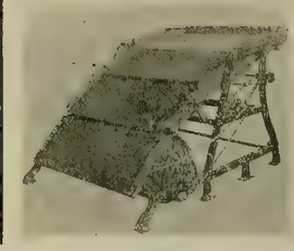
BAILY & MONNIG, Managers.

Pacific Amalgamator.



PATENTED APRIL 20, 1897.

Why this Machine should be used in Gold Mills and Placer Mines: 1. It will make a large saving over the ordinary Plates, or any other Amalgamator. 2. It will catch float gold or quicksilver that may escape from the mortars or sluice box. 3. It requires less attention than the ordinary Plates. 4. It costs but little more than the common Plates; no other Plate required. 5. It is simple, durable, and the only sensible plan of amalgamation. **A Special Machine built for Klondike and Alaska.** Agents wanted. Address PACIFIC MINING MACHINERY CO., 127 First St., San Francisco, Cal.

Assaying Gold
.....AND.....
Silver Ores.

A Standard Work.

By C. H. AARON.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the pratical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price $1.00 postpaid. Sold by the Mining and Scientific Press, 330 Market St., San Francisco.

If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,
330 Market Street.....San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.
Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 180 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Prospector's Field Book and Guide.
By H. S. Osborn.....$1 50

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....$3 00

Modern Copper Smelting.
By Edward Dyer Peters, Jr. Seventh edition. Rewritten and enlarged. Profusely illustrated....$5 00

Practical Treatise on Hydraulic Mining.
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dumps; duty of miners' inch, etc Price, postpaid.....$5 00

Practical Hydraulics.
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Explorer's and Assayers' Companion.
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

The Metallurgy of Gold.
By M. Eissler. Profusely illustrated.....$5 00

Notes on the Treatment of Gold Ores.
By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

Cyanide Processes for Gold and Silver Ores.

Market Reports.

The Markets.

SAN FRANCISCO, Dec. 2, 1897.

Business continues to hold up well, but jobbers fill orders from stocks carried, so as to have little on hand at the close of the year for stock taking purposes. The consumptive demand has been exceptionally good so far this winter, with prospects of its continuing. Market values continue to ease on nearly all lines owing to somewhat of a selling pressure. Manufacturers, taken as a whole, are doing better than at the corresponding time last year. This applies to about every branch. Leading foundry and machine men are quite sanguine that next year will witness a decided increase in business. The certainty that several lines of steamers will run to Alaska and a Japanese line to Japan are creating a very hopeful feeling regarding next year's business in every branch of trade and manufacture. Eastern advices state that general trade has been and continues very good, with more wage-earners at work, and an increase in pay made by quite a number of employers.

In the local market there is nothing new to report. The call for accommodations is light, while funds in bank are steadily accumulating. There is said to be quite a falling off in the number of loans that are called in at this season of the year, chiefly for the purpose of paying dividends and interest. It is stated that disbursements next month in this city on interest and dividends will run up to over $5,000,000. These disbursements include those by incorporated companies and municipal, State and national authorities. With this large sum added to that already on hand new avenues for investment will be sought, particularly for loaning on good security. The rates of interest will be easy.

SILVER.—The market firmed up the past week in this city, New York and Europe, but at the close it is stationary. Light obtainable stock is quickly felt on any improved demand at home or abroad. It is also quite possible that the meeting at New York of representatives of the large smelters in the United States and Mexico may have something to do with the advance. The meeting was held for the purpose of devising ways and means to bring about higher prices for the white metal by limiting offerings or otherwise. The smelters represented are said to handle over 60,000,000 ounces of silver a year, which shows their importance. With a combined movement in this country, Mexico and Australia, the world's production can be easily handled in the interest of sellers, but can such a combine be effected?

Silver miners everywhere West are interested in the efforts of the smelters and refiners of the country to organize what, if successful, will practically amount to a trust or combine. The plan is to pool issues and store silver bullion at convenient points to be held until prices shall advance sufficiently to warrant sales at fair profits. The heaviest dealers in silver bullion are confined to about a dozen large smelters and refining plants. It is estimated that each of these has capital enough to enable it to carry 2,500,000 ounces of silver for a period of four months. Plainly put, if the efforts at pooling are successful, this will mean the withholding from the market of 32,500,000 ounces of silver for the period named. As the market on Nov. 20 carried only 27,277,565 ounces of silver, exclusive of that held in the United States main and sub-treasuries, which is tied up by silver certificates issued against it, it will be easily seen that the pool can cause an appreciable rise in the price of the white metal. One of the men at the head of the pooling movement writes as follows: "If by pooling issues, withholding from the market the metal until it can be sold at a profit, and not, as now, at a loss to producer, we can bring about the results inevitably attained by the dealer in wheat or other staple commodities, why should we not do so?"

MEXICAN DOLLARS.—There is a continued free export movement to China. The advance in Silver has stiffened Mexicans, with sales in a small way made by brokers over the counter at 47⅓ cents, but for round lots we doubt if over 47 cents could be realized today.

COPPER.—The market at the East and abroad is quiet, but this is usual to the holiday season. Our advices do not indicate that holders will force business, but are content to hold in expectation of an improvement soon after the holidays. If India harvests as large crops as reported, then she will buy copper more freely.

Our market is quoted as follows:

Ingot casting, jobbing	13 @—
Ingot " wholesale	12½@—
Sheet copper	— @16½
Bolt	¼ and 5-16, 20c; ⅜ and larger, 16½

TIN.—The market is quiet for spot. Some sales are reported for next season's delivery. It is the impression that fully as much will be used on this coast next year as was this year. There is some cutting by Americans to get a better hold here.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " " light, "	4 00@—

SHOT.—The market is steady, with a continued good demdnd.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 40
Drop, B and larger sizes, " "	1 65
Buck, Balls and Chilled, do, " "	1 65

POWDER.—The market is firm with a good demand.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¼c, according to strength and quantity; No. 2, from 9 to 11c, according to strength and quantity.

ZINC.—The market is firm.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

ANTIMONY.—The market is steady.

Our market is quoted at 8¼c in a jobbing way. New York mail advices quote 8c for Cookson's, 7¼c for Hallett's and 7c for Japanese.

QUICKSILVER.—The demand is light but the market is steady. There were only ten flasks forwarded to Mexican ports by the last outgoing steamer.

Our market is quoted at $39 for domestic consumption and $35@36 for export to the west coast of Mexico.

LEAD.—The market has held steady throughout the week. The consumption is light, but this always obtains at this season of the year.

Our market is quoted in jobbing lots as follows per 100 pounds:

Pig	4 75	@	5 00
Sheet	6 30	@	6 80
Pipe	5 60	@	6 10

IRON.—In our market there is nothing new to report. The consumption for the season of the year is quite free. The East reports a free consumption, but the very heavy output is against sellers.

NAILS.—The market is steady, with only a fair demand ruling.

We quote the following basis: 20d to 60d, inclusive—wire $2 35, cut $2.25.

COAL. — Lower temperature causes a larger consumption for household purposes. For steam and gas the usual demand rules, although it is said that more Steam has gone into consumption than at the corresponding time in 1896. Receipts of coal for the week ending with Tuesday were as follows in tons: Comox 5550, Coos Bay 1960, Puget Sound 7500, Cook's Inlet 700, Coquille River 150, Nanaimo 2504, Departure Bay 2412; total, 17,776.

COKE.—Imports the past week aggregate 1661 tons from England. The market is steady.

The market is quoted as follows:

Gas Companies'	— —	@	— —
English, to load	— —	@	— —
" spot, in bulk	11 00	@	— —
" in sacks	12 00	@	— —
Cumberland	10 00	@	— —

IRON.—The market is essentially unchanged. The consuming iron shows a slight falling off in this city, but it is expected to set in towards March of 1898 in increasing proportions. The East does not report any material change.

AMERICAN.

	To Arrive.	Spot.
Sloss	$20 00	$22 00
Thomas	21 00	22 00
Salisbury	29 00	31 50

ENGLISH.

Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

PLATINUM.—The market is firm.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

BORAX.—The market is fairly firm.

The market is quoted as follows:

Refined, in carload lots, in barrels	5½
Refined, in carload lots in sacks	5¼
Powdered, in car lots	5½
Concentrated, "	5

Chemicals.

The market is quiet, but there seems to be a better feeling along the line in sympathy with the East, where there is a slight strengthening reported in some, but, as yet, no advance has been established.

SULPHURIC ACID.—The demand is quiet.

We quote in a jobbing way at 1½c per lb for 66%.

ACETIC ACID.—The market is firm at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported steady from store at 6½@7c per pound in carboys.

BONEASH.—There is a slow demand at unchanged quotations.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

BLUE VITRIOL.—Our market is steady, with better inquiry.

We quote in a jobbing way at 4c per pound.

SPELTER.—The market is steady.

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is firm.

Our market is quoted in a jobbing way at $1.40 a pound.

SODA ASH, 58% (LeBlanc process).—The market is steady at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is weak at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—The market is quiet at 2½c a pound from stores.

NITRATE OF SODA.—After dropping to low figures for shipments there is a stronger tone, with a slight advance asked. This seems to indicate that the fight is drawing to a close.

Our market is quoted from store at 4c for 95%.

PHOSPHORUS.—The market is steady.

We quote in a jobbing way at 70 to 75 cents per pound.

Mining Share Market.

SAN FRANCISCO, Dec. 2, 1897.

The milking process of securing desirable shares at low prices is in evidence, and as has been the case heretofore is proving a great success. A short time ago, when prices ranged higher, it was all ore, and rainbow chasers bought eagerly, with the majority getting on a margin. Now that prices are low, with several as low as they ever get, cappers, camp followers and paid or interested writers' refrain is, if only ore can be found. The writer has stated time and again that one or more good-sized bodies of ore can be developed any time desired by the moneyed insiders, and it is only charitable to say that the smaller pools or cliques are ignorant of it. It is the knowledge of these ore bodies and the promising outlook for far better times next year that make moneyed insiders desirous of getting all the shares at low prices they possibly can. They recognize the fact that money was never so plentiful, and with returning confidence at the East and on this coast the general public will enter into any gamble that promises quick and big returns on the money risk. They also know that although the Comstock mines have been badly abused, as has the share market, yet outsiders with money, too, will venture in the game, particularly if the market is made active by lively and at times violent fluctuations. The success attending the marketing of the Kaffirs in England shows that there is plenty of money for investment, and it is safe to affirm that the Comstock shares can be made as lively and bring as much money as at any time in their history. The work in some of the mines on the Comstock continues to be of a kill-time character, and it is not at all likely this will be changed until some time next year, when times are favorable for a bull campaign. It is stated that West Con. Virginia will start work next month. There are many who have faith in this mine. The steady advance in silver is favorable to the mines on the lode.

The news from the Comstock mines, outside of official advices, is hard to get. In this respect it is no different from what has at all times been the case when the market is down and shares not money is wanted by insiders. So far the attempt to attract attention to Justice has not proven a success notwithstanding well informed mining men have confidence that a large body of ore will be uncovered, but more work and time will be required to bring it about. They think that what has been will be again. It looks now as if very important work will be started next year at one or more points on the Comstock which will galvanize it with life again. In Utah they are still going west with no change reported. In Andes the material encountered shows a slight improvement as they go north on the 175-foot level. Quite important work is being done in Sierra Nevada on the Layton Tunnel level. The new tunnel is being pushed ahead as is the north drift on the 900-foot level. In Union they are running a west crossdrift on the 900-foot level, but it will be stopped or else turned aside when it approaches the ore in the west, unless the shares are well in hand. They continue blocking out work on the 1000-foot level of Mexican. In the west crossdrift of Ophir on the 1000-foot level the change in formation is said to be quite favorable, although a longer distance will have to be run before they expect to strike ore. They are crossdrifting west on the old central tunnel level in Ophir. Active work is being done in Con. Virginia on the 1550-foot, 1650-foot and 1750-foot levels. The general belief is that good results will follow, but it may not before lower prices rule for the shares, as it is said there are some blocks out which insiders need in their business. They continue to extract and mill low-grade ore from the 400-foot Bonner shaft level in Gould & Curry. The work in Savage is about the same as heretofore published. No work in Hale & Norcross. In Chollar they are working on the 100-foot level so as to develop the same ore found in Potosi.

They are slowly but surely repairing the main incline above the 1100-foot level. In Potosi the south drift on the tunnel level is being pushed slowly. They are extracting a few tons of ore each day. On the 500-foot level of Alpha they are running a northwest drift. At last advices it was in low-grade ore. There is still a strong flow of water in the Confidence-Challenge-Con. Imperial west drift. It is out about 1630 feet. The surface tunnel in Con. Imperial is in over 415 feet. Reports are current that in Yellow Jacket they have struck ore towards the Kentuck line. They are doing some important work in Crown Point which indicates more active exploiting before long. In Belcher they are crossdrifting west on the 850-foot level and are also repairing and retimbering the north drift on the 1200-foot level. No ore is being extracted, which will not call for an assessment for milling charges. In Overman they are still at work on the 900-foot level. A few tons of ore are raised weekly. In Justice they are working on the 175-foot level. They raised last week ten tons of ore assaying about $36 to the ton.

From the Brunswick lode there is absolutely nothing new, although the active work which is being done may develop into something important any day. In Potosi they continue work on the south drift 500-foot level and also on the east crossdrift. In Chollar active work is continued on the 300-foot, 500-foot and 600-foot levels. On the two latter it is exploiting. They raised about eighty tons of ore last week of fair grade. In Occidental active work is being done on the 550-foot, 650-foot and 750-foot levels. On the latter level they expect to reach the downward continuation of the ore in about two weeks. In Savage they are exploiting the 600-foot level. Joint work by Con. Virginia, Best & Belcher and Gould & Curry is confined to the 300-foot and 600-foot levels. Nothing new is reported from it.

The following illustrates the changes of the week:

WILL NEGOTIATE with owners or their duly authorized agents only.

WILL INVESTIGATE only thoroughly bona-fide properties, either Mines, Prospects or Mineral Lands, whose owners are willing to make reasonable terms. When sending reports on properties also send terms on which you are willing to sell or lease.

E. N. BREITUNG,
Marquette, Mich., U. S. A.
Operator and Dealer in
Mines, Mining Properties and Mineral Lands,
Mining Stocks, Bonds, Options, Leases, Contracts and Securities.
MONEY LOANED ON BONA-FIDE MINES

WILL EXAMINE on reasonable terms all kinds of Mines, Mining Properties and Mineral Lands as to their value, method of working and the condition of their titles.

WILL GIVE Options, Leases, Bonds and Contracts on all kinds of Mines, Mining Properties and Mineral Lands.

Assay and Chemical Work Done on Reasonable Terms.

Have best of bank and other references. Use McNeill's or A B C Telegraphic Codes.

DO ALL OUR OWN EXPERT AND CHEMICAL WORK.

Working Capital for Mines.

PACIFIC EXPLORATION COMPANY

Will form companies and find capital to develop mines on shares or commission. Miners who have a good prospect should write the manager of this company for particulars. Address W. E. HOLBROOK, Manager, 29-30 Chronicle Building, S. F.

Commercial Paragraphs.

UNDER date of Nov. 23rd the Colorado Iron Works Co., Denver, Colo., report the following shipments: Two carloads smelting machinery to Descubridora Mining & Smelting Co., Mapimi, Mexico; one carload mining machinery to Kilton Gold Reduction Co., Florence, Colo.; one carload mining machinery to Moon Anchor Mining Co., Cripple Creek, Colo.; one carload water backs for smelter for El Paso Smelting Works, El Paso, Texas.

THE M. C. Bullock Mfg. Co., Chicago, have shipped one of their Champion drills with complete 1000-foot outfit, including boiler, pump, stand-pipe, casing, etc., to the German syndicate operating in British Guiana. This order was secured only after a practical demonstration of the merits of the machine. Two machines with complete outfits were shipped last month to Johannesburg, and they have orders for others which they are now bringing through their works. They are receiving numerous calls for their hand-power diamond drills as well as the larger sizes; and, judging from present indications, the coming season is to be a busy one in this particular line.

WILLIS SHAW, Contractors' Machinery, Chicago, Ill., reports the following recent sales: 75 H. P. double drum mining hoist to J. D. Hardin, Deadwood, South Dakota; quarry machinery to the Mitchell Lime Company of Mitchell, Ind.; 80 H. P. air compressor to the "Soo" Line, Minneapolis, Minn.; hoisting machinery to the "Big Four" Railroad at Ludlow Falls, Ohio; steam tug to James Stewart & Co., St. Louis, Mo.; two locomotives and an equipment of "Shaw" dump cars to Vandegrift & Jacobs for use on the Duluth & Iron Range Railroad; 75 H. P. mining hoist for the Great Eastern Gold Mining Co. of Deadwood, So. Dakota; 50-ton steam shovel to the Marion Brick Works at Marion, Ind.; and a carload of hoisting engines to Major Harrod of the New Orleans Drainage Commission.

WM. H. BIRCH & CO., of the California Machine Works, San Francisco, have a contract to build three sternwheel steamers for the Alaska Exploration Co., each of the following dimensions: Hull, length over all, 175 feet; beam, 35 feet; depth, hold, 7 feet; draught, light, 18 inches; built to carry 250 passengers and 400 tons freight each. T. P. H. Whitelaw is building the hulls. The machinery is to consist of tandem compound engines with high pressure cylinders 16 inches diameter, low pressure cylinders 28 inches diameter and 84-inch stroke; main shaft, 10 inches diameter by 26 feet 4 inches long; wheel, 21 ft. 6 in. diameter, 20 feet wide; boilers of the fire-box type, 72 inches diameter by 24 feet long, with a working pressure of 165 pounds of steam. Wm. H. Birch & Co. have contracted for all machinery and boilers.

Rainfall and Temperature.

The following data for the week ending 5 A. M., December 1, 1897, are from official sources, and are furnished by the U. S. Weather Bureau for the MINING AND SCIENTIFIC PRESS:

CALIFORNIA STATIONS.	Total Rainfall for the Week.....	Total Seasonal Rainfall to Date.....	Total Seasonal Rainfall Last Year to Same Date.....	Average Seasonal Rainfall to Date.....	Minimum Temperature for the Week.	Maximum Temperature for the Week.
Eureka	.90	9.27	3.48	8.49	34	60

Colorado's Gold Fields, Illustrated.

Just out, with correct map and nearly 100 mining views natural as life. This valuable book will be sent free, prepaid, with our big 56-col. family paper 3 months on trial for 25c; club of 5 and 5 books $1. Latest mining news. Mention THE PRESS and address *Illustrated Weekly Sentinel*, Denver, Colo. Cripple Creek is fully described.

British Columbia.

E. S. TOPPING, TRAIL, B. C.,

Has prospects for sale in Trail Creek and the whole of the Columbia basin. Will buy legitimate stock and mines for investors. Will examine mines. Has lots for sale in Trail and Deer Park.

DEWEY, STRONG & CO. PATENTS 330 MARKET ST. S.F. SCIENTIFIC PRESS PATENT AGENCY

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING NOVEMBER 23, 1897.

594,317.—PETROLEUM BURNER—F. C. Bates, San Jose, Cal.
594,234.—BICYCLE BRAKE—A. W. Duck, Oakland, Cal.
594,293.—DOOR WINDOW—J. Elwood, Sanger, Cal.
594,350.—CAR-BEARING ADJUSTER—C. V. Greenmayer, Los Angeles, Cal.
594,038.—PACKING MACHINE—E. Hanuk, Sacramento, Cal.
594,139.—METAL ROOFING—J. J. Knowlton, Oakland, Cal.
594,091.—GANG PLOW SEEDER—W. C. Matteson, Stockton, Cal.
594,092.—GANG PLOW—W. C. Matteson, Stockton, Cal.
594,351.—MINERS' CANDLESTICK—C. S. McCready, Bodie, Cal.
594,093.—ENVELOPE—W. McNaul, Bradley, Cal.
594,104.—FLAX THRESHER—J. Switzer, S. F.
594,043.—ROD COUPLING—Thompson & Abbott, Salinas, Cal.
27,882.—DESIGN FOR SPOON—R. Schaezlein, S. F.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CRUDE PETROLEUM BURNER.—F. C. Bates, San Jose, Cal., one-half assigned to J. W. Holland of same place. No. 594,317. Dated Nov. 23, 1897. This invention relates to an apparatus which is especially designed for the purpose of burning crude petroleum and particularly for burning it in stoves which are employed for cooking, heating, etc. It consists essentially of an enclosing box or case adapted to fit the firebox of the stove or other structure within which it is to be used; a horizontally disposed tray having shallow peripheral side flanges and means for introducing a regulated supply of petroleum to the bottom of the tray, a perforated pipe with means for controlling the supply of water thereto, so that the water is converted into steam which is discharged to mingle with the vapors of the hydro-carbon, an opening in the side of the case for the delivery of the burning gases, so that they may be carried up over the outside of the box and a preliminary igniting tray situated below the main tray, whereby the latter may be heated preliminary to the supplying of oil to it.

BICYCLE BRAKE.—Abram W. Duck, Oakland, Cal. No. 594,234. Dated Nov. 23, 1897. This invention relates to improvements in bicycle brakes, and it consists essentially in the employment of a pair of frictional rollers journaled at an angle with the line of travel of the wheel tire, so that when pressed downward upon the tire they produce by this difference in their planes of rotation a frictional pressure which is exceedingly effective in checking the movement of the wheel to which the brake is applied. This brake may be operated by any of the usual hand or foot levers upon either front or rear wheel, but a very convenient way of operating it has been found by connecting the rod which carries the rollers with a bell crank lever centrally fulcrumed curving backwardly over the handle bar, thence diverging a short distance parallel with the top of the bar, thus allowing the rider to actuate the brake by pressure with the thumbs of either or both hands.

WANTED

POSITION AS SUPERINTENDENT OF GOLD Mining property, quartz or gravel, or would travel as expert for good company. Address, "EXPERT," MINING AND SCIENTIFIC PRESS, San Francisco.

WANTED.

LOW PLACER GROUND
IN CALIFORNIA, FOR DREDGING PURPOSES.
Must Exceed 50 Cents per Cubic Yard.
Send full description with price and terms to
W. H. BARRY, Occidental Hotel, S. F., Cal.

FOR SALE, AT A BARGAIN.

A complete Champion Prospecting Diamond Drill Outfit. Good as new. Used very little. Does successful work. For price apply to GOLD HILL MINING CO., Angels Camp, Cal.

FOR SALE CHEAP.

First-Class Air Compressor (Steam driven) and Drill, New.

Also, 3-Ton Capacity Pulverizer.

A. L. FISH, 59-61 FIRST ST., San Francisco.

GOLD! Promoter and capital desired to put in operation a new phenomenal gold extraction method which also manufactures gold. Address Box 576, Lincoln, Nebraska.

HORACE F. BROWN, CONSULTING ENGINEER.

Special attention given to preparing plans for the Chlorination and Bromine Processes of Treating Gold Ores.

PATENTEE { Brown's Complete Automatic Mill Process. Brown's System of Mechanically Stirred Roasting, Cooling and Conveying Furnaces, Etc.

1607-8 Manhattan Building, Chicago, Illinois.

DEWEY, STRONG & CO., Patent Solicitors, 330 Market St., San Francisco, Cal.

Lunkenheimer's "Clip" Gate Valve.

Single Disc DOUBLE SEATED. Made with Screw Ends from ¼ in. to 3 in. sizes.

BEST IN QUALITY.
LOWEST IN PRICE.
THE ENGINEERS' FAVORITE.

These Valves are made of cast iron and all wearing parts of gun metal. They are superior to the common, cheap, brass valves with which the market is flooded.

WHY?

BECAUSE they possess all the advantages of a cast iron pipe fitting (Elbow, Tee, Coupling, Union, etc.) namely are heavy and rigid not injured by expansion and contraction or rough handling in pipe fitting. TAKE PRESSURE FROM EITHER END. Body and hub are held together by a steel clip, consequently always easily taken apart. Joint between body and hub made permanent by an imbedded seamless oval copper wire washer. If you desire the BEST, STRONGEST and MOST DURABLE valve for general purposes on all ordinary pressures, use this valve. IT IS A STANDARD FITTING, OF NEAT APPEARANCE and FULLY WARRANTED TO SATISFY. Made also in All Iron for Cyanide Plants. Try them and be convinced. Specify them and order through your dealer. Our Catalogue of superior Steam Specialties, FREE for the asking.

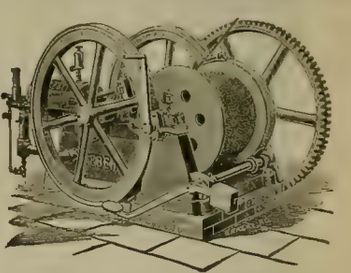
Weber GASOLINE HOISTING ENGINE.

MONEY SAVERS.

Costs to run One Cent per Horse Power per Hour. No Coal or Wood and very little water required.



This cut represents our 10, 15, 20, 30, 40, 50 H. P. Geared Hoist.

Hoisting for 32 Cents Per Day.

SAN PEDRO, N. M., April 23, 1897.

WEBER GAS & GASOLINE ENGINE CO.,
KANSAS CITY, MO.

GENTLEMEN—Yours of the 14th at hand. The 10 H. P. "Weber" Gasoline Engine Hoist we got is "out of sight," and the longer we run it, the better we like it. We are now down with our shaft in the neighborhood of 175 feet. We only work one shift. All it costs us for gasoline is 32 cents per day. It takes us from three to four hours a day to do our hoisting. Yours truly, J. T. MCLAUGHLIN.

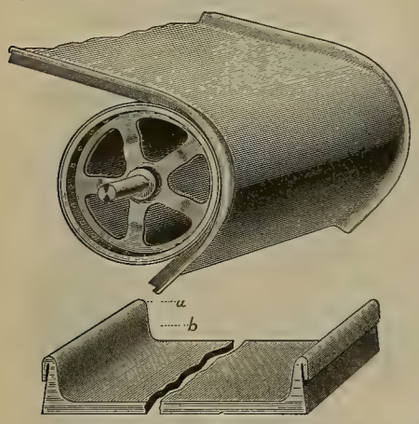
THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.



It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

SUPT. OFFICE WILDMAN GOLD MINING COMPANY, }
SUTTER CREEK, AMADOR CO., CAL., Feb 22, 1897. }

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: Replying to your favor of the 18th inst., will say that in the two mills operated by this company we have nineteen of your Patent Lip flange concentrator belts in use; some of them have been in constant use for the past two years and have given entire satisfaction. I know of no better flange for a side shake machine.

Yours truly, JOHN ROSS JR., Superintdenent.

MEXICAN MILL, EMPIRE, NEV., March 28, 1897.

MR. J. S. BROWNELL, San Francisco, Cal.—DEAR SIR: For some years we have used three different styles of belts on our Frue vanner at the Mexican mill, and for smooth working and endurance the Brownell Patent Lip flange belt has proved its superiority over all others, and I unhesitatingly recommend it to all who are using Frue machines.

Yours truly, EUGENE MAY, Foreman.

ROPP STRAIGHT LINE FURNACE

FOR ROASTING, CHLORINATING AND DESULPHURIZING ORES.

Extracts from Letters Received from Mr. Philip Argall, Manager the Metallic Extraction Co., Cyanide, Colorado:

January 2, 1897.

"The roasting is invariably good. We can do 80 tons per day to 0.13% sulphur, when everything runs s[illegible]th. Our month record which, of course, includes all delays, is 1700 tons, from 1.94% sulphur to 0.3[illegible]

February 19, 1897.

"Our [illegible] running very nicely indeed, averaging 90 tons per day to 0.10% sulphur, and doing excellen[illegible]t, it has improved right along and we are highly pleased with it.

"For 24 hours [illegible] to-day 102 tons were roasted."

The ROPP F[illegible]NACE is now in successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake City, Utah (one furnace); The Metallic Extraction Co., Cyanide, Colo. (one furnace); The Colorado-Philadelphia Reduction Co., Colorado City, Colo. (three furnaces); The Selby Smelting & Lead Co., Selby, Cal; (one furnace); The Mount Morgan Gold Mining Co., Rockhampton, Queensland (one furnace); and Broken Hill Proprietary Co., Broken Hill, New South Wales (two furnaces).

Vein Structure in Nevada Co., Cal.

In the issue of Nov. 6th appeared some illustrated mention of vein structure in Nevada Co., Cal., which has elicited much remark. Therein was noticed the character of the Idaho-Maryland, the Mountaineer and Omaha veins, where the vein consisted of a filling of white quartz from 2 to 3 feet wide between two parallel surfaces, with local pinches; in places the vein losing its regular character by reason of brecciating of the hanging wall. Another class of vein to which the Empire and North Star and others belong, presents more complicated structures. In them the simple clean break is replaced by a compound one, in which two or more distinct fractures have been formed at a distance of a few feet; between these lies more or less crushed and brecciated rock. Quartz-filled fractures lie along the hanging wall, the footwall, or along any minor break in the rock between the walls. The latter may more or less distinctly assume the character of a breccia cemented by quartz. It is usual, however, to find the main quartz vein close to the hanging wall. The rock between the walls is always most altered by metasomatic processes. The little veins and seams, sometimes (as in Fig. 1), forming a network in it, are predominately composed of calcite.

FIG. 2.— NORTH STAR VEIN, NEAR 1800-FOOT LEVEL, SHOWING QUARTZ VEIN IN BRECCIATED AND ALTERED DIABASE.

This structure is also illustrated by Fig. 2, both illustrations being from the North Star—the one near the 1700-foot level, the other near the 1800-foot level. The hanging wall is generally more distinct than the footwall. In these examples the evidence of extensive movement along the vein is less pronounced, the brecciated structures indicating a sudden short break rather than a long-continued grinding of the walls against each other. Schistose structure, due to the latter condition, occurs in places—for instance, along both walls of the Idaho-Maryland and the North Star, but only in the Ural and Merrifield veins does it become prominent. In these the quartz, where the vein is simple, is adjoined by several feet of schistose rocks, produced by the pressure and movement along the fissure; where the vein is compound, smaller streaks and seams of quartz are distributed through this schist, which may attain a width of 20 feet or more. The width of the quartz vein may in some cases attain several feet. On the Merrifield vein a width of 6 and 10 feet of solid quartz has been observed, and in the Ural vein, in the Nevada City mine, one smaller ore body reached 12 feet. Ordinarily 2 to 3 feet is the width of the Ural and Merrifield veins. Some veins in the Nevada City district do not average 2 feet in width. In the U. S. Geological Report, 1895–6, Waldemar Lindgren, from whose article on vein structure is quoted, says: "The Grass Valley veins are narrow, excepting the Idaho-Maryland, Gold Point, and a few more, and scarcely average 18 inches in width. Many veins, such as Houston Hill and Norambagua, have paid wel with an average width of 6 inches, or even less. Seams with only an inch or two of quartz will sometimes contain an extraordinary amount of gold."

FIG. 1.— NORTH STAR VEIN, NEVADA CO., CAL., NEAR 1700-FOOT LEVEL, SHOWING 2-FOOT QUARTZ VEIN AT HANGING WALL AND ALTERED DIABASE WITH CALCITE SEAMS BELOW.

In 1890 Colorado produced $4,156,229 in gold. For '97 that State expects to show a gold output aggregating $18,000,000. The great increase is due to the slump in silver, the universal search for gold, the improved scientific and mechanical devices for successfully handling low grade ore, and judicious advertising.

Recent articles in British mining journals about American mining investments, meaning, largely, California mining investments of British capital, would lead to the inference that "Yankee tricks," whatever they may be, were matters of usual local practice. In this regard it is interesting to note on page 554 of this issue the remarks of the chairman at a recent meeting in London of the Drake Properties, Ltd., where he says that the experience of his company with "the American vendors" was in every way satisfactory.

Senator Stewart's views on the proposed change in the Federal mining laws are given on page 550. Of course he opposes the general idea. He filed a caveat in this matter a generation ago and wants no interference with what he considers his vested rights. Sometime he will not be in the U. S. Senate. When that day arrives it will be easier to secure necessary changes in the mining laws of this country. Senatorial courtesy, respect for age, adherence to tradition and official inertia make slow the advance of reform.

Inquiry is still received at this office from possible and probable Klondike adventurers, asking for information as to prospects in connection with that new El Dorado. Nothing good can be said that is new, and nothing new can be said that is good. Disappointment awaits nine hundred and ninety-nine out of every thousand who start. There is no use to go to Dawson City unless one has several thousand dollars to buy a claim. He stands no show to otherwise secure ground in that vicinity, and the average Eastern man who would start on an adventure of that kind has no need to go, if he has as much money as would be required to make the trip and get anything. That men can get to Dawson next summer is an easy problem. Many of them will turn back almost immediately after arrival, a few will scatter out, but the vast majority will be terribly disappointed. Our advice is that no one should think of starting for that country without the possession of a stout constitution, at least one thousand dollars in money, and with the full knowledge that he is risking his life; and that even should he win wealth, it will be at the expense of his health.

Of Immediate Importance.

A Golden Jubilee Mining Fair is proposed to be held at Mechanics' Pavilion, San Francisco, beginning January 24th, 1898, and ending February 6th, 1898, all exhibition space to be free. This is the business part of the coming Golden Jubilee, celebrating the fiftieth anniversary of the discovery of gold in California, and it is worth the attention of every one directly or indirectly connected with the mining industry in California. It deserves and needs the active and hearty co-operation of all to make it the success that it can be and should be. Energetic men have taken hold, committees have been appointed, the preliminaries have been about arranged, but there still remains a great deal of actual work to do.

The Mining and Scientific Press has been asked to again call special attention to the propriety of the miners of the State making due exhibit. This enterprise is purely an advertisement, and as an advertisement it should be considered. It is the province, and should be the immediate purpose, of every mining county in the State to make due and creditable display of its mineral products at the Mechanics' Institute Exposition Building during this Jubilee Fair.

Superintendent Gilmour desires it publicly announced that after the 20th inst. he will be ready to receive and to properly place all exhibits forwarded to him. It is understood—but cannot now be definitely stated—that Wells-Fargo will transmit free such exhibits. This is a matter that should need no further urging on the part of this paper. Probably the better way would be for each county to arrange to what extent it shall take part in this exhibition, and who shall manage it. There will be room for all. Immediate organization in this regard is necessary. In all counties where there exist County Miners' Associations in connection with the California State Miners' Association, those in charge of that organization should immediately make arrangements for attractive and effective displays, contributing the best display of mineral wealth it can secure, together with all possible in the way of maps, models, etc. It is intended in general, during the exhibition, to give due prominence to every department of gold mining in this State. Where there is no county organization the most prominent and influential miners in such county can consider themselves appointed as a committee to take charge of this work, and to do all possible to secure proper representation in their county. On the principle that what is everybody's business is nobody's business, these things are sometimes neglected. But the time is short and enterprise and public spirit will suggest that necessary action in this regard be immediate.

This is the opportunity for the mining counties of California to have appropriate advertisement. This is the age of advertising; no matter what one has, if he wants it known, he must advertise it now. This rule applies to all cases whether it be an individual or a nation. The time has gone by when it is considered necessary to argue affirmatively the necessity of advertising; it is universally recognized. Widespread advertising is what has created the present Klondike attraction. Colorado understands this matter thoroughly. That enterprising State is now sending out two finely equipped palace cars full of samples of ore, finely colored portraitures of mining scenes, milling plants and descriptive literature, correct, truthful and up-to-date, which is to be distributed from the cars as they progress through the region east of the Rocky mountains. They are to traverse the leading railroads of the United States. Colorado is a splendid advertiser; her railroads annually spend tens of thousands of dollars, and the reward is reaped by the bringing in of money into that State. In this, Colorado is ahead of California. California has always maintained pre-eminence in the gold yield of any commonwealth in the United States; Colorado holds second place and proposes, if push and enterprise can do it, to rank first. It is for California to say whether it will or not. Such an exhibition as this to be held in this city in the early part of '98 will largely determine that.

The time is most propitious, when thousands of energetic men will shortly be headed this way en route to the Klondike. Whatever may be said of their judgment, it must be remembered that mining crazes are as periodical as financial panics. At present the craze is toward the Klondike, and it must run its course. It is largely for California to say how much of the enterprise and energy will be directed this way. There is no sentiment about this matter; it is purely a business proposition. Men are going to the Klondike by the thousands—many of them without the remotest idea of what gold mining is, or how it is done. This proposed California exhibition will be a practical object lesson to them, and particularly from the fact that it is proposed to make it worth their while to buy their outfit in this city. The scientific, practical and economical manner of gold mining, as shown at this exhibition, and the display of the State's mineral resources, would naturally affect them favorably toward this State.

We of California know that it is unnecessary for gold hunters to leave the boundaries of the State; or once here, to go elsewhere to find what they seek; but because we know it, does not argue that others have that information. There is a dense amount of ignorance existing as to the extent and present importance of the mining industry, and it is for the State that has thus far held the lead in the gold production of the world, to dispel that as much as possible.

This is not a matter solely for San Francisco; it is the business of the State, and should be an enterprise fostered and furthered by the entire commonwealth. The question for those who are subscribing to the fund in this city is not just how much they shall individually benefit by it; but what are the direct results that will accrue from their subscriptions in the way of increased trade, in which they must necessarily share. If one-tenth of those who come with money and energy to seek fortune in the drear Yukon region can be shown by practical actual proof that California is the better place to expend their energy and money, it will be of material benefit to the commonwealth; and it is with this end in view that the mining exhibition proposes to have its largest measure of success.

So far, the Mining and Scientific Press has refrained from proffering any advice regarding the details of working up this entire matter—which was first suggested in these columns; but it cannot refrain from directing the attention of those engaged in the furtherance of the scheme to the immediate necessity for extensive advertising in the East. Every dollar so expended will be returned a hundred times over. By "advertising" is not meant the distribution of little circulars and dodgers now being sent out. These don't amount to anything, anywhere, any time, for any purpose. The jubilee and the fair should be thoroughly exploited and noticed in the different business centers of the Union. It would pay the special committee having charge of this part of the work to get some experienced advertising man to take charge of that entire matter. If the reports in the dailies are to be credited, the advertising part of it is being very weakly conducted. Space should be at once secured in all the leading Eastern papers, and the matter fully advertised therein. The Associated Press would gladly aid in the matter, if it were properly placed before the local managers; and this kind of advertising would be most effective of all, for, as in other things, there are things that money cannot secure, and that kind of advertising is the best. Seattle and Portland have shown what is possible in that regard, and San Francisco should not be slow to profit by their example. These two enterprising cities have sent out, through their Associated Press agents, statements that necessarily fell under the eyes of millions of people. This could be done from here and should be done at once. Everyone who reads a newspaper in the Union could thus be made aware of the fact that in the State where gold was discovered fifty years ago, and which still leads in its annual production, the Golden Jubilee of such discovery will be appropriately celebrated; and that in the chief city of that State will be a mining exhibit of six weeks duration, which will show the latest and best methods of gold mining in all its branches, and which will be an epitome of the half-century of successful mining that has been the chief factor in creating the prosperity of the State and building up this west half of America.

Cheap Mining and Milling of Ore.

Some reference was recently made herein to the low rate of mining and milling gold ore in various localities—South Dakota, Colorado, Australia, Alaska, and California. Subsequently a statement appeared from one of our traveling correspondents that at the Monte Cristo mine, east of Jackson, near Volcano, Amador county, this State, where the vein carried an average value of $2 per ton, ore is mined and milled at an average cost of 60 cents per ton. This statement has elicited several inquiries as to its authenticity, the low cost of mining and milling having attracted considerable attention. The statement is believed to be substantially correct, though details are not to hand.

Such low rate is, however, not unprecedented in this State. At the Spanish mine, Washington, Nevada county, Cal., has been furnished a similar record. There the vein averaged 90 feet in width, the hanging wall being a soft shaly slate, the pay ore being found on that side. There was a 1200-foot tunnel, the vertical distance from the surface being 350 feet. The ore was hauled out by gravity, the empty cars being hauled back by mules. The ore was passed through a Blake rock breaker and ground in roller mills, of which there were three of 5 feet and one of 4 feet diameter. The mills made fifty-eight revolutions per minute and were fed by automatic ore feeders. The following is a record of one month's run of the mine:

MINE—COST OF PRODUCTION.

Run: Twenty-eight days' work produced 3143 tons of ore.

	Labor.	*Supplies.*	*Total.*
Extracting ore	$ 703 50	$113 41	$ 816 91
Delivering ore to mill	160 20	17 95	171 15
Dead work	105 20	10 93	116 13
General expense	78 35	1 95	80 30
Total	$1,047 25	$144 24	$1,191 49
Cost per ton	304	042	346

MILL—COST OF REDUCTION.

Run: Twenty-four and a half days reduced 3443 tons of ore.

	Labor.	*Supplies.*	*Total.*
Mill expenses	$ 227 32	$194 33	$ 421 65
Water for power	.....	161 70	161 70
Handling ore	154 50	5 35	159 85
General expense	78 40	1 95	80 35
Total	$ 460 22	$363 33	$ 823 55
Cost per ton	133	106	239
Bullion produced			$3,138 55
Total expenses			2,015 04
Profit			$1,123 51

It will be seen from this that the ore only yielded a trifle over 91 cents per ton, yet a profit of 32.6 cents per ton resulted, the total cost of mining and milling the ore being 58½ cents per ton. The percentage of profit was 35.8 of the total. In the previous month 2796 tons of ore were worked, which yielded $1.16 per ton. The profit was 56 cents per ton, or about 48 per cent of the total. The profit that month on a yield of $3,268.49 was $1,572.91. The cost of mining that month was 37½ cents and of milling 23 cents per ton, an average for the two months of 59½ cents per ton.

A Case in Point.

It will be remembered that the last California Legislature passed a law which, among other things, abolished mining district recorders in this State. Several sections of that law have been generally condemned by practical miners. Last July, in a case involving this point, before the Superior Court of Mono county, Cal., Judge Virden decided the law to be unconstitutional. So far as known, the case has not been carried to the Supreme Court of this State. Commenting on several communications received in this office from various parts of the State on this subject last September, the MINING AND SCIENTIFIC PRESS set forth very clearly that, however distasteful the law may be, the right of the State to make such law is absolute, and its mandates must be complied with. The best way to secure the repeal of a bad law is to strictly enforce it, and it is not improbable that the next State Legislature will repeal this statute. As to Judge Virden's decision (without discussing its justice), it is certain that, were it appealed to the Supreme Court of the State, it would be reversed.

A case directly applicable to this has recently been decided by the Supreme Court of the State of Utah (in which State a similar law was recently enacted), the decision being in the last number of the *Pacific Reporter* in re Monk, page 810, wherein J. T. Monk, who was recorder of the Big Cottonwood mining district in Salt Lake county, Utah, was ordered by due process to deliver to the recorder of the county the records of his district. He refused to obey, was adjudged guilty of contempt and committed to prison. Monk was afterward brought before the court on writ of habeas corpus, but was remanded to prison. From the order refusing to liberate him he appealed to the Supreme Court. Chief Justice Zane of the Supreme Court goes over the case at some length. The following paragraph is directly applicable to the controversy in this State regarding this same matter:

The petitioner also contends that the provisions of the State law above quoted, requiring county recorders to perform the duties performed before by the district mining recorders, and requiring the latter to deposit the books and records of their offices with the county recorders of their respective counties, conflict with a law of the United States regulating the disposition of its mineral lands. The claim is that section 2324, Rev. St. U. S., confers the authority upon the miners of the respective mining districts to make regulations governing the location, and recording of all papers necessary to hold possession of mining claims and required to be recorded. The provisions of the above section of the law of the United States, so far as material to the point, are: "The miners of each mining district may make regulations not in conflict with the laws of the United States or with the laws of the State or Territory in which the district is situated, governing the location, manner of recording, amount of work necessary to hold possession of a mining claim, subject to the following regulations: * * *" This law gives the miners the authority to make such regulations not in conflict with the laws of the United States or with the laws of the State or Territory. The Federal Government has made no provision for a recorder in mining districts. The authority to provide for recorders, and the recording of all papers to be recorded in locating and holding mining claims, is left to the States in which such locations are made. If the State does not exercise the power, the miners of the district may. By enacting the law in question, the State has used its power. The judgment of the court below appealed from is affirmed.

Of Present Importance.

A decision of considerable interest to holders of unpatented mining claims was made last week by Judge Rust of Amador county, in this State, in regard to the important matter of proper assessment work. Practicelli, plaintiff, located a quartz claim in the Clinton Mining District, Amador county, January 1, 1897, and recorded it the next day. The defendant, Gilbert, had located the same claim February 23, 1892, and assumed throughout to have valid possession. Plaintiff denied that during the year 1896 defendant had performed any labor or placed any improvements thereon, and claimed that defendant had forfeited all rights thereto. The decision (which covers three ordinary newspaper columns) showed that the Judge entered fully into the merits of the case, the pivotal point being whether or not the defendant, in 1896, expended any labor or placed any improvements to the amount required by the Federal Statutes, that being the year plaintiff claimed defendant had not done so, and that such neglect entitled him to enter and make his claim on January 1, 1887.

There was a great deal of evidence, all of which tended to show that considerable money had been spent by defendant on the property, shafts sunk, tunnels run, pipe laid, etc.; but that the last actual development work, within the meaning and intent of the statute, was done prior to March 20, 1894, and that in the year 1896 no real assessment work had been done. It was evidently a case wherein he believed he was doing all that was required, but, unfortunately, ignorance was no excuse. He seemed to have considered that by living near the claim and being frequently upon it, by pounding up rock, taking out samples, washing decayed quartz, etc., he was complying with the statute. But the law, which says that labor and improvements, actual and valuable, to the amount of $100 shall be performed each year, was not complied with; hence, though manifestly reluctant, Judge Rust was obliged, according to the strict construction of the law, to give judgment in favor of the plaintiff. The property is believed to be valuable, and the incident should be a warning to careless owners of unpatented mining claims—that unless the law is complied with, they are at the mercy of anyone who sees fit to take advantage of their remissness. Only twenty days remain to perform the work necessary to hold any unpatented mining claim on which such work has not been done for the calendar year ending December 31, 1897. This, however, does not apply to any mining claim originally located subsequent to January 2, 1897, on which the locator has till December 31, 1898, to do the required assessment work.

ANY CASE involving tunnel site locations always excites considerable attention. The latest reported is from Colorado. The contest is between W. S. Stratton, owner of the John A. Logan claim, and the Gold Sovereign Mining and Tunnel Company. This case does not involve the ownership of a lode or other discovery. The tunnel company claim the right to pass through patented ground in the prosecution of its work. Mr. Stratton enjoined the company, claiming that he owned the patented location; that his rights of possession dated back to his first location, which was made prior to the location of the tunnel company, and that the defendant had lost whatever rights it ever possessed by failure to prosecute the work, required by the Colorado statute. He also claimed that the statute of Colorado of 1897, giving tunnels the right of way to cross patented claims, violates the State and Federal constitutions and is void. Defendants claim that the case could at best be one of trespass, for which an injunction could be issued or refused; that the tunnel could not cut plaintiff's vein by reason of position, and that the broad construction given by the Supreme Court of the United States in the Rico-Aspen case justifies their position. This case does not involve the ownership of ore bodies encountered in driving a tunnel, its sole importance being as to the question of right under the law for a tunnel to pass through private ground. If the State law is sustained, a tunnel company can run its line through both end lines of a patented claim, traversing the lode for 1500 feet, to the detriment of the claim owner's plans for working and an attendant increase of cost for development of the property. The decision will be looked for with considerable interest.

THE Los. Angeles (Cal.) Mining Exchange is now dealing in non-assessable stocks, somewhat after the Colorado method, and some criticism is vouchsafed in contrast to the San Francisco method of handling stocks which are subject to assessment. This matter has been so often discussed that little remains to be said that has not been better said already. To those who approach the subject with settled convictions either way argument is useless. Where the company has plenty of money at the start probably the non-assessable plan is a good one, though usually corporations on that basis come to grief in case of the refusal on the part of stockholders to agree on some plan for providing sufficient development funds. True, owners of assessable stock may be frozen out, as indeed any good thing may be abused; but so far as is known no successful substitute has been found for an assessment where money is needed to prosecute further work, with the alternative of either supplying the money or shutting down. So long as men are of different minds, some willing to put up money, others unwilling, so long the plan of assessing stock as usually practiced in this State will obtain.

THE Atlantic & Pacific Aerial Navigation Company of San Francisco seem to have the courage of their convictions, so far as furnishing money is concerned. They contemplate the building of an airship and have secured from the Pittsburg Reduction Company of Niagara Falls, sheets of aluminum of unusual size. They propose to use these sheets in the manufacture of a cylinder, which will be 38 feet 2 inches in diameter, and 9 feet in length, with a forward cone of 50 feet and a rear cone of 45 feet. They propose to use this cylinder in the construction of an airship which will cost $15,000, weigh about 5000 pounds, and carry one ton of passengers and provisions. It is proposed to propel this machine by a gasoline engine of 100 H. P. This the company thinks will solve the problem of transportation to and from the Klondike.

FROM New Haven, Connecticut, the city of colleges, comes important information of the formation there of a company to extract gold from sea water. The process, (which, of course, is secret), has all been "thought out." The principal stockholder says he would not take $1,000,000 (one million dollars) for his stock. Additional information is vouchsafed that a grist mill will be used, probably to secure the flour gold.

Hydraulic Gravel Elevator.

Gold-bearing gravel worked by the hydraulic process is washed down by streams of water, under great pressure, thrown against it through nozzles. One problem is to get rid of the tailings or debris after the gold has been taken out in passage through sluices and undercurrents. It sometimes is easier to find the gravel in place than to find a place for it after it is washed down. It is this mass of waste material which brought up the debris question in California. To properly work one of these hydraulic mines, means must be provided for the washed-down gravel, dirt, rocks, etc., to be carried away. This cannot be done by hand, the volume being too great. Accordingly the miner, in working such claims, runs deep bedrock cuts to the face of the bank, so as to give suitable fall for the water to carry the waste off. The dump must be lower than the bottom of the gravel, which rests on the bedrock. Without sufficient down-grade from the mine to the dump the mine cannot be worked under ordinary conditions. Sometimes long bedrock tunnels have to be run (as at the North Bloomfield) in order to get this fall, but generally deep cuts in the bedrock serve the purpose, and in them the sluices to save the gold are placed.

The hydraulic gravel elevator permits of the debris or waste being lifted and run off through a flume. By this means low ground, without fall, may be worked; or the debris can be thrown back into old workings and kept out of the streams. The cut on this page shows the application of this system where the mining ground is lower than the dump, representing the elevator in place, with its outer discharge flume conducting the washed material of earth, sand, gravel, etc., to a final dumping point.

DEBRIS PASSING FROM HYDRAULIC ELEVATOR VIA FLUME.

The principle upon which the operation of the hydraulic gravel elevator is based is the fact, well known by hydraulic miners, that water and gravel can be driven uphill by hydraulic force, and that in a flume it is only necessary to give the impelling water more velocity to make it carry more earth or gravel before it. Miners, to accomplish this, give their flumes more grade. It is, therefore, only necessary to give water more velocity than it has through an ordinary flume to make it acquire sufficient force to carry gravel up an inclined plane. This fact long since suggested the construction of a form of machine which should be so direct and confine the inherent force of a hydraulic stream as to impel before its power masses of earth or gravel or other heavy material.

An inclined pipe is connected with the flume and one end led to a sump or depression in the ground. The open end of the ground section of the pipe is concave in shape, or a lower half-section of pipe flaring outward, into which the earth, sand, gravel, etc., are sluiced by hydraulic giants; the elevator entrance and throat sections are set in a chamber excavated below the bedrock surfuce. The material sluiced into this entrance is taken up by the stream issuing from a fixed hydraulic nozzle, which, by its impinging force, impels it forward and upward through the pipe to its point of discharge into the open flume above, whence it is carried away through a line of sluice boxes to a final dump. Confined as this material is within this tight iron pipe, it is necessarily impelled forward with the velocity of the stream itself, and as each particle of gravel or other material is directly acted upon by the full force of the stream discharged through the hydraulic nozzle it is necessarily disintegrated by this action, as well as by the friction along the pipe in its ascent, and the pulverization is complete.

Of course, it costs more to work a mine on this plan than on rough hydraulicking. More water must be used, for there must be a nozzle for the elevator to force the water up, as well as a separate one to wash the material down from the bank, and each of these nozzles must have a supply of water under pressure. But by using this system areas which have been piped out in the past can be utilized as reservoirs for impounding the debris from the remaining banks. This system has been successfully used for some time in this State, Colorado, Montana and British Columbia, mainly for working ground too low to provide suitable fall; but it can also be used, where circumstances favor, for working mines where the debris can be thrown back into reservoirs and kept out of the streams. The waste water is also forced up with the gravel and debris, though sometimes an injector, also operated by water, is used to lift this waste water to the flume that it may flow off.

Some Notes on Glacial Action.

Written for the MINING AND SCIENTIFIC PRESS by WALTER C. CHAMBERLAIN, Geologist.

Following close upon the cessation of volcanic activity in the mountain ranges of the Pacific slope, a glacial period, which is supposed to record from about 250,000 years ago, took place.

It appears—quite a remarkable coincidence—that immediately following the close of this tremendous outburst of fire and latent force through volcanic rents of the Sierras, and other ranges of the coast, a condition of glaciation should have enshrouded this portion of the globe, yet a strong body of evidence goes to prove that it really occurred, transforming the Sierras from their aspect of a seething cauldron of ruddy glow to one of a cold and lifeless mass, in the brief transition between the Pliocene and glacial ages.

The mighty forces exerted by glaciers, and their capacity for transportation, appears to be more marked further East than in some of the Middle States, where immense rocks, weighing many thousands of tons, transported hundreds of miles, stand as monuments of evidence to the powerful energy of these ancient herculean rivers of ice; although this has been disputed, many inferring that glaciers were not the agency by which these deposits of ponderous rocks were made. However, scientists are open to any explanation, and any rational reason for their presence through any other source would be willingly listened to. I fail to see how any power outside of the enormous force of glacial action, which exerts an energy equal to forty pounds to the square inch for 100 feet thickness of glacial ice, could have accomplished such a feat; certainly water has not the power for such transportation.

There have been various arguments advanced by scientists in reference to the altitude of the earth's surface during the glacial age, some claiming that a glacial period is an impossibility without abrupt elevation of some sort, others asserting that glacial periods are produced from physical phenomena, in conjunction with some slight geographical change of the earth's surface.

In the Pliocene age the mountain ranges of the Pacific coast had quite an elevation, which is shown by the Pliocene rivers. In the East this is not the case, the Middle States at present being devoid of elevation above an ordinary prairie level. They may have had an elevation sufficient to furnish gravity to the moving masses of ice, but it seems more plausible to believe that where this large distribution of rock took place was but a shallow sea, covering a submerged continent, glacial activity being, therefore, confined to the highest mountain ranges, which furnished rocks and other detritus that adhered to the glacial discharge in the form of icebergs. It hardly seems possible that a whole continent would rise and subside in order to furnish a glacial condition. In studying the subject it appears that the energy exerted by glaciers came from the north or northeast—from the direction of the pole, at least—and was not universal. If caused by extreme elevation, it was confined chiefly to the influence of the above direction. If from physical cause, the solving of the phenomena will be open for future study.

Returning to the Pacific side of the discourse, glaciers during their periods of operation in the Sierras, aided by atmospheric agents, made great inroads on all classes of friable lithological matter and outcropping ledges in their path. From two to three thousand years of glacial energy by these colossal engines of nature would outclass the work of all the stamp mills in the world for years to come. If this theory holds good, the placers of California would have been far richer had the glacial period occurred previous to the Pliocene age, the surface being then in a virgin state. Dissolution of rock through such a source would have been comparatively an easy task.

The Pliocene age, which preceded the glacial period, was a very peculiar one in geological history, because it marked such a complete revolution of conditions, and especially in the mountains of the Pacific slope. Previous to the short geological age which forms the transition between the two ages in question, the Sierra Nevada mountains were the scene of powerful volcanic eruption, the seat of the activity extending high up into the range. This long siege of volcanic action caused emissions of lavas which were remarkable for their intricate variety and high percentage of silica. Trachytes, liparite and rhyolite followed one upon the other in close succession, finishing chiefly with a capping of basalt, a material which is slowly acted upon by erosive or other agencies, and noted mainly for the protection it gives to the underlying strata. Its indestructibility has proved a shield to all classes of matter covered by it, and in some places it reaches a thickness of a thousand feet or more, having smothered the Pliocene ledges and rivulets with their precious sediment of gold-bearing gravels, where they must await release at the hand of the indefinite future. These two mighty forces occurring so close to each other marks two geological ages of great import to the past history of auriferous deposits on this coast.

Glaciers, and the conditions which attended them, were nature's stamp mills of prehistoric time, and were it not for the canopy of basalt which guards the treasure of our golden Sierras, as though it played the part of a sarcophagus, under whose massive seal reposed a deceased and much-lamented monarch, the gold output of California would have been a subject for our imagination to wonder at. As it is, mining in California, from a standpoint of science, is an industry only in its beginning, with a long and glorious future for all who exploit it with prudence and honesty.

AN artificial stone now being made at Woking, England, by the Owen process, consists of 87½ per cent of quartzose sand and 12½ of lime, which, first being sifted and mixed, are subjected for thirty-five hours to a hydrostatic pressure of sixty pounds to the square inch. A distinctive feature of the process is the boiling of the water used before it is pumped into the pressure chamber, the driving out of all air in this way being claimed to obviate blow holes and similar defects in the stone. The product improves with exposure to the atmosphere, being capable in a month of standing a pressure of 4000 pounds to the square inch. It is cast to any desired form in steel moulds. Pieces of the material have been repeatedly subjected to sudden cooling from a high temperature and to freezing—while saturated with water—and sudden thawing, without any signs of disintegration.

A "Pocket" Horizon in Trinity County, Cal.

Written for the MINING AND SCIENTIFIC PRESS by OSCAR H. HERSHEY.

Between the foot of the eastern slope of the White Granite mountains, which occupy the northwestern portion of Trinity county, and the summit of the Trinity range, which constitute its eastern boundary, is a region of mountains and valleys which is pre-eminently a "pocket country." Topographically it is characterized by steep slopes between 500 and 2000 feet in vertical amplitude, with narrow crest ridges and almost equally as narrow valley bottoms. Beginning on the west, there is first a long slope to the axis of the valley of the East fork of Stuart's Fork of the Trinity river, thence a rapid rise to the crest of the Minerva range, on the east of which is the deep valley of the Trinity river. Beyond it the ridge crests rise to an altitude of between 4000 and 5000 feet above the sea and culminate in the summit of the Trinity range. Every portion of this mountainous area is easily accessible to prospectors and good wagon roads follow the main streams.

The main features of the geology of the region are simple. There is a basement rock series of igneous or ancient quasi-volcanic material. Its prevailing characters on outcrop in the area under discussion are those of a compact, fine grained, dull green massive rock closely resembling certain varieties of basalt. When exposed it has a ragged appearance because of extensive jointing, but it lacks the stratification lines of slate. Near the surface it is very frequently amygdaloidal, the original rounded cavities being now filled with white quartz. Several hundred feet below the top of the formation it becomes coarser grained and finally passes into a coarsely crystalline rock of gray color and a composition like diorite.

Resting upon the igneous formation is a series of alternating thin-bedded black slates and thick-bedded blue quartzite which collectively constitute the black slate formation of probable Carboniferous age. In general, the slate formation remains practically in its original horizontal position except that it is gently arched with an axis along the summit of the Trinity range; but considered in detail it is much disturbed by faults and imperfect folds of small dimensions so that locally it presents dips of high degree, in not a few cases vertical and even overturned. The igneous formation has participated in these disturbances to a certain extent so that the contact between the two varies as much as 600 or 1000 feet in altitude between the two sides of a narrow ridge. In the valley of the Trinity river, the contact line averages several hundred feet above the stream level between Trinity Center and Eastman gulch, but in places rises to 700 or 1000 feet and in others the black slates come down to the river level. But disregarding the local variations it may be said that the green igneous rock forms the foundation of the entire region, outcropping in the valleys, passing through under the mountains to reappear in a distant valley or gulch. The black slates form the bulk of the mountains, capping every ridge and always seen in place above the green rock. The valleys are merely gigantic ditches cut by nature through the black slates and into the green rock below. These facts are of great importance to future mining operations in the region in question.

The contact between the massive green igneous formation and the black slates has so far proven to be the "pocket" horizon of the territory. Some gold in quartz ledges of low grade has been found in the green rock formation and perhaps a little may be scattered through the black slates above, but all the "rich strikes" have been made at or in the immediate vicinity of the contact. By reason of a long period of weathering in some ancient time, the green rock near the contact with the black slates has been softened and semi-decomposed and changed to a dull brown in color. It is popularly known as porphyry, but is as far from being a true porphyry as it can well be. Immediately above the contact the black slate frequently has a shining luster, a coal-black color and a schistose structure quite unlike its usual characters. Sometimes there is a thin vein of quartz between the so-called porphyry and the black, slaty material, but generally they are separated merely by a thin seam of ferruginous dirt or by nothing at all. The dirt seam often carries a little free gold, but the "pockets" are found where seams of quartz penetrate the "porphyry" downward from the contact. The gold lies in a thin, flat sheet upon the igneous rock and under the slate, and in some cases extends a short distance into the former formation, rarely into the latter.

Without discussing the causes of the presence of the gold at the contact, I wish to call attention to the fact that there is abundant evidence that only a very small portion of the gold so distributed has yet been recovered. The region has been prospected in a desultory way for years, but the contact line has been but little more than scratched; yet this scratching has in some cases been well repaid. The Van Ness mine, between the summit and the Trinity river, on the road from Redding to Trinity Center, has in the past few years yielded several pockets aggregating over $20,000 in value, and some gold continues to be taken out and recovered by such a primitive method as a simple sluice-box. These pockets all came from at and near the contact between the igneous rock and the black slates and were found close to the surface. It is preposterous to suppose that these few "pockets" were the only ones formed at this contact in this particular district. It is true that no others have yet been found, but it is equally true that the contact has not until quite recently been opened up except at the Van Ness mine.

On the west side of the valley of the East Fork of Stuart's Fork of the Trinity river, all the little gulches from Minersville north several miles, including Farley, Ragged, Italian and Haywards and on the opposite side of the ridge the Chicken, Little Chicken and French gulches draining into Digger creek, have proven rich in quartz gold distributed through the alluvial gravels up to a certain point above which there is little or none of this particular variety of gold. This point in every case is the contact line between the igneous rock (the so-called "porphyry") and the black slates. It is a popular idea that certain so-called "black seams," which are a mixture of quartz, slaty material and dirt and occur a short distance above the contact, have yielded the gold; but I do not think this idea is correct. I believe the gold to have been derived through the erosion or cutting away of the contact line, and that search for the remaining portions of the deposits should be made not in the "black seams" or other quartz ledges, but by uncovering the surface of the igneous formation on both sides of these small gulches. In confirmation of this conclusion, I may refer to the case of the Bonanza mine in the valley of Digger creek, about one and one-half miles above Minersville. This is situated at the contact of the two predominant formations of the region. Recently a $4000 pocket was taken out at the contact, having the "porphyry" for a footwall and the schistose black slate on top. Several other "pockets" have swelled the total output of this mine to between $8000 and $9000. These sums are small, but the returns are large in proportion to the amount of work done and capital invested.

It is safe to assert that the tract of land in the angle between Digger creek and the East Fork river contains sufficient gold in "pockets" at the contact of the igneous and black slate formations to make it at some future time one of the richest mining districts of small extent in this part of the State, but it will require capital to develop it. Some other portions of the "pocket country" will prove equally rich (judging from the placers in the gulches), but clear evidences of the presence of "pockets" are less numerous in the greater portion of the area than in the Minersville district. However, many a little gulch has a line of quartz gold extending up to the contact at the base of the black slates that has never been prospected by pocket hunters, but which indicate the presence of more or less free gold at the contact throughout the region.

It will readily be seen that the conditions governing the distribution of the gold "pockets" in the black slate area of Trinity county are such that it is not a good country for the average tenderfoot prospector. An occasional "pocket" which is near the surface may be found by the ordinary methods in use by the professional "pocket" hunters; but to get at any large percentage of the gold, which a scientific study of the region indicates to exist at the horizon of the igneous rock and black slate contact, the expenditure of large sums of money to run tunnels is required. The gold at this horizon is much in the form of a blanket vein and should be mined like the coal veins of the Mississippi basin. Because of the uncertainty of returns owing to a want of knowledge of the particular rules which govern the situation of the "pockets" on the plane of the contact, capitalists are loth to venture any of their money into a "pocket" mining scheme; but I believe that a large company with plenty of capital could, by selecting some small district like that in the angle between Digger creek and the East Fork river, and opening up the contact on a large scale and by scientific methods of mining, safely count on the certainty of rich returns. This is one of the great chances of Trinity county.

English Capital in American Mines.

TO THE EDITOR:—I write to earnestly endorse the article contributed by Mr. A. B. Paul under the caption of "English Capital in American Mines," and printed in a recent issue. Volumes of interesting reading on the same lines could be furnished by mine owners of California.

The author of the communication published in the London *Mining Journal*, referred to by Mr. Paul, might become more enlightened and change his opinion of California as a mining State if he would forego the time and expense to make the proper investigation for himself, instead of sitting quietly in his office formulating opinions based upon absurd theories, such as he refers to in the case of Capt. Johns. It is true that Mr. Johns is an experienced miner, that he has traversed the mountains of California many times during the past twenty years in search of a bonanza for his English company. It is also true that he has either passed or turned down many good mines, and a few bonanzas are now known to be among them. All or any one of them he had a chance to secure at a low price.

The failure of this English company to secure all the handsome dividend-paying mines desired is not for the reason that California could not supply them, nor that they did not have a chance to purchase. To illustrate, I will cite a most positive proposition that this company rejected. The Black Oak mine, in Tuolumne county, was examined by Mr. Johns less than two years ago. That mine then showed an ore reserve of $387,000, and, in addition to this, the bottom of the lower level showed a larger vein and still higher grade for a length of more than 200 feet. The owners at that time were being pressed for money to pay mortgaged debts then overdue, with foreclosure proceedings staring them in the face, and for that reason alone the property was offered to Mr. Johns for $225,000. Mr. Johns submitted the proposition, together with his report, and recommended the purchase, but his company, fortunately for the owners, declined.

The shaft has been sunk 200 feet and two levels run since, which now shows a ledge, considering its width, length and value per ton, that is perhaps unexcelled in this or any other State.

GEO. W. CAMPBELL.

Amending Federal Mining Laws.

TO THE EDITOR:—The resolutions offered by Col. W. S. Keyes in his speech before the Miners' Convention last held in San Francisco, as published in the PRESS, are radically wrong, with the exception of his fifth proposition. Objections to his second resolution have been given to the public through the columns of the PRESS, and have had their effect on Mr. Keyes to the extent that he is willing to allow a sufficient width of ground on lode claims to allow the lode miner to sink to a depth of from 1800 to 2000 feet—that is, he is willing the lode miner shall have a lateral width on one side of his lode the following: For 1800 feet deep at angle of 45° for the lode, 1272.798 feet width of surface ground; for 2000 feet deep, same angle of dip, 1414.22, or nearly as much lateral width of claim as the length of a lode claim now allowed under the law. By such a law he would shut out from the prospector that amount of land less 300 feet that is, under the law, open to him. But what would he do with lode claims whose dip of lode is at other angles than 45°? A law to be efficient and simple should be general in its application, at least to the same class of mineral claims. No locator could apply this proposed amendment until he had sunk his shaft to a considerable depth and had time to determine the angle of his lode, as the angles cannot generally be determined from the surface or by any short depth of shaft.

Mr. Keyes' third and fourth propositions are unnecessary. Miners' rules and regulations are generally giving way to the Revised Statutes, and the present code of mining laws are complete and intelligible to any one except perhaps a hungry lawyer without a brief. The most that ought to be asked is an amendment more clearly defining what are mineral lands and what Mr. Keyes asks in his fifth resolution, which is a good one, and should have received more attention than he has apparently given it.

His sixth is faulty in several particulars. It should not prohibit prospecting by means of a tunnel for blind lodes. Lodes that float rock therefrom show that they probably exist, but of which no croppings are visible, and are applied to so-called "dead rivers" or deep gravel channels. He does not allow ground enough to pay for the outlay of capital necessary to explore a deep gravel channel. He says nothing of the width to be allowed, and by the language used does not allow location until the channel has been encountered.

His seventh proposition is faulty—very much so—in that he would locate lodes of any kind of mineral rocks that are properly veins or lodes or are classed as such under placer mining laws.

Mr. Keyes' eighth resolution is simply confiscation of the property of the prospector or miner who is without capital. A failure to apply for patent before Jan. 1, 1900, shall constitute a forfeiture of his possessory rights to mining property that he has himself discovered or bought. This is just what it means. If the miner cannot for want of money apply for patent, he must be deprived of his holding without recompense therefor, and provision should be made that the neighboring claim owner shall assist in this piece of injustice; and if the miner without means has a neighbor on either side of his holding, a bone of contention is at once presented for the two to quarrel over. Means are here provided that the wealthy mining companies may in time acquire the property of all the companies with but little capital by a process called "freezing out."

Every resolution offered by Col. Keyes but the fifth is calculated to tie up the prospector's pick. No. 8 in particular would do this and in addition stop the operations of all mining companies which have not capital enough to compel their neighbors to respect their rights. The suggestion is made that

the people of the United States adopt the mining code of Canada or Mexico. Why should we do so? Our own laws are the most free on earth. In Mexico a concession must be obtained before anything can be done, and taxes on everything pertaining to mining are heavier than within our own borders. In Canada a license must be obtained before prospecting can begin and other taxes that must be paid yearly, besides taxes on value of property. Here there is one restriction—the prospector must be or have declared his intention to become a citizen. Our own code of mining laws are not perfect, but they are better than that of any other country, for they do not bar the citizen from trying, nor rob him of his "find" if he is successful in his quest, whether be be poor or rich.

E. H. MOORE.

Nevada City, Cal., Nov. 26th, '97.

Practical Working of Drift Mines.

Written for the MINING AND SCIENTIFIC PRESS by FELIX CHAPPELLET, Supt. Eureka Consolidated Drift Mining Co.

Regarding the working of gravel from drift mines, it is difficult to give exact statements covering particular cases, as much depends on the location of the claim. A good outlet, a deep and steep canyon to dump in, so as to give a good grade to the sluices, also the proper amount of water which can be disposed, the cost of that water, etc., are among the first considerations. Assuming that everything is satisfactory as to the outlet, canyon, water, etc., I prefer sluices with a good grade, with as many drops as conveniently possible to build; also one or two undercurrents on the way. I prefer this to patent washing apparatus, which must be watched, need repair and power to run. Still, there are circumstances in which a mine may be forced to use some of those machines. With a good dump at the head of the flumes, a small monitor to prepare the dirt before it goes in the sluices, is a great help. The flumes and riffles must be kept in good order. Blocks or riffles raise often enough to prevent the sand or clay becoming hard between them. I have been working cemented gravel for many years, and have only the ideas which experience gives any miner.

To work cemented gravel, stamps are best—heavy stamps, so as to crush any hard pebble in one blow. If the mill could be built on the side of a deep canyon, and had water power, I would put in a rock breaker so as to help the stamps and crush fourteen to eighteen tons per stamp. In front of the battery should be tables of the same width as the mortar, so as to give the pulp the chance to travel very thin on the tables. On these tables should be grooves 1½ inches wide by ¾ of an inch deep, cut from one side of the table to the other, the grooves to be about 16 or 18 inches apart. Tables should be 10 to 12 feet long. In these grooves put quicksilver, the grooves well filled, and when the pulp passes on top of these grooves it takes the gold. The important thing in milling is to always have the quicksilver in a clean state; in fact, everything must be clean in a mill. A drop of grease or oil or dirt on the quicksilver prevents amalgamation. Below these tables I would advise to have rubbers, one for each table. These rubbers were used in early days in quartz mills to save quicksilver and sulphurets. Concentrators have taken their place in quartz mills, but I think they are good in gravel mills where concentrators are not in use. These rubbers save the quicksilver which may escape from the grooves; besides, it helps to force the amalgamation of the gold, black or coated. These rubbers are small expense, take about ¼ H. P. each, and they will pay for themselves in a short time. Below these rubbers are sluices to catch floating black quicksilver. My experience is that with such equipments hardly any quicksilver is lost, consequently no gold.

Senator Stewart on Mining Laws.

Senator W. M. Stewart of Nevada was recently interviewed by the Denver *Republican* regarding the proposed change in the Federal mining law, and said:

"I think several changes in the present law are necessary, but I do not believe the substitution of vertical side lines for the present apex law will cover the points involved, or that mining men of the country would permit such a provision to pass without determined opposition. The passage of such a law would necessitate so large a surface area to give the locator all his rights on the vein that it would practically shut out the prospector, who would not have a chance of owning his claim, and if we throw the prospector out of a job we put a definite stop to all mining, for it is these fellows, who roam around the hills to find a vein, who keep the mining industry alive.

"I am inclined to believe that the provisions of the law regarding assessment work are too often evaded, and something should be done to insure the proper observance of the law in that respect. The assessment work is merely an evidence of good faith on the part of the locator. It should not be so trifling either in the terms of the law or in practice that men should be enabled to hold large tracts of land without doing sufficient work to prove their earnestness. Perhaps it would have the effect desired if claimants were allowed to commute the work required by law for $50 per annum in cash, but in this event there must be some provision of law which would compel those who prefer to do the assessment work to actually perform the stipulated amount of work. They might be required to produce the certificate of the surveyor general that $50 worth of work had really been done, which would probably cost them more than the $50, and would result in the commutation for cash of the work required in all cases, or it might be secured, as I understand is recommended by the proposed law, by a provision requiring a certain number of cubic feet of rock work or a certain number of cubic feet of loose dirt. In the latter case the annual certificate would be unnecessary, and the matter might be left to the courts in the event of litigation whether the legal amount of work had been done. It is probable, however, that an annual certificate of labor performed would be necessary in order to defeat attempts to evade the law.

Vertical Side Lines.—"Another objection to the vertical side line proposition occurs to me. It would not do to cut a vein in two with a side line within any reasonable distance from the apex. The entire principle of mining law rests upon the fact that the discoverer of a vein is entitled to the whole of that vein as far as he is able to follow it into the bowels of the earth. To limit a claim to 1320 feet square—forty acres—would not give locator enough of his vein. Take the Comstock, for instance, which has followed its dip on the vein for more than a mile. It will be readily seen that to give a locator surface ground which would enable him to follow his vein to that distance within vertical side lines would require a very large surface area, very much larger than the forty acres contemplated by the proposed law, and this would be against the interests of the prospector, who would not be able to secure a title to his land after he had found his lode.

"Regarding the proposition to do away with the requirement for the discovery of a lode, as a condition of possessory rights and ultimate title, I do not think it would be wise under any circumstances. It must be borne in mind that it is a matter of no particular importance whether the Government obtains $50 a claim as a consideration for possessory rights or not, but it is of the utmost importance to the nation and the Government that mineral shall be discovered and the resources of the country developed. In the event a person should be permitted to locate one or more claims without previous discovery of mineral, and claim possession by the payment of an annual fee, it is very easy to see what would happen under certain circumstances. The requirement of the annual payment or the actual amount of labor represented thereby would probably operate against wholesale appropriations of land under ordinary circumstances, but the moment a rich discovery is made the surrounding territory would be filed upon and held by men able to pay a $50 fee, and thus the purpose of the law, which is always to induce development, will be defeated. This would not only operate against the prospector, whose protection should always be one of the main considerations of our mining laws, but against the public interests, as the land would be very largely held for speculative purposes, and the development of its mineral wealth retarded for years.

A Possible Compromise.—"It is possible that upon a careful examination of the proposed law some compromise might suggest itself upon which both sides in this controversy might stand. Keeping in view the idea that the locator should be protected in his right to his vein as far as he is able to work it, it may be possible to permit the vertical boundary proposition to stand, by giving the locator a preference right to one or more claims on the side of the dip of the vein. Do not understand me that I favor such a compromise. I have not given the matter sufficient thought and at present I am not favorably impressed with the vertical side line idea. I admit the necessity for some changes in the law, but I am opposed to any very radical changes. I will make a careful study of the matter and will certainly do whatever I can to simplify the law and render it more effective for the ample protection of the honest prospector and the active development of the mineral resources of the country. During all of my service in Congress I have been compelled to fight for the possessory rights of the prospector. When I first entered the Senate there were but three men in that body who knew anything about mining, Conness of California, my colleague and myself. That was during the war, when there were various schemes devised for the purpose of raising money for the expenses of the Government. One of these schemes was proposed by Julian, then a member of Congress from Indiana, who presented a bill for the sale of all the mines of this country located upon public lands at auction. He was elected to Congress on this issue three or four times and finally succeeded in getting his bill through the House in 1866. I prepared my bill, which was necessarily very crude, and it was passed through the Senate, but it went to the bottom of the calendar in the House, and there did not appear to be any chance for its passage at that session. Higby of California had a bill in the House affecting water rights, and I got him to tack my bill to his. Then I had it passed through the Senate again, and then came one of the hardest fights I ever had in Congress. I followed the bill to the House and interviewed every member on it.

"Bills were pending for the establishment of two navy yards in New England—one in Connecticut and one in Maine—and I found that we three senators held the control of the situation on them. I traded with the senators and members interested, and took advantage of a number of other jobs that were pending which required my three votes in the Senate to carry them through. The majority of the members of Congress did not know anything about mining and were inclined to favor Julian's bill, as they had not the vaguest idea of the value of our mining territory, and the measure promised them some money in hand at a time when money was sadly needed. In working for the measure I was nearly all the time on the floor of the House, and Julian objected to my presence as an invasion of the privileges of the House. The Speaker finally ruled that, as a Senator, I had a right on the floor of the House. The fact that the law was coupled with a bill regarding water rights accounts for the awkwardness of the title of the laws of 1866. The bill passed by a small majority and became the law. When I got through with the work, I was so exhausted with my two months that I threw myself on my bed at 5 o'clock in the afternoon with all my clothes on and did not wake up until 7 o'clock the next morning.

The Present Law.—"The law, as I have said, was crude, and it was soon found that it did not fill the demands. In 1872 I prepared the present law and had it passed, and, while there are some things in which it doubtless needs amendment, it has given fair satisfaction for twenty-five years, and I think is a reasonably good law.

"The rulings of the Land Office are the main difficulties with which the miner must contend. I have been obliged to oppose the Land Office almost constantly. The Interior Department wanted to have sole control of all mining matters without the intervention of the courts and I had to oppose that, for that meant that every miner in the country would be at the mercy of the construction placed upon the law by some $1200 clerk. And even now some of the rulings of the Land Office are rank. The recent ruling permitting patent for a group of claims to pass upon the performance of only $500 worth of work is an outrage.

"The proposition to create a Department of Mines and Mining will come before the Senate, and, of course, I cannot say what action I may take; but it is my impression that there is a better chance to secure a Bureau in the Interior Department, as the first step toward getting a department created. When members of Congress see the amount of labor involved in connection with mines, they may be more willing to create the department. The creation of a Bureau will be a long step in that direction."

The Principle of Business.

No calling requires a greater use of brain power than business, and few require a higher order of general ability. The great secret of success in business—the secret, in fact, of success on a large scale—is to conceive of it as a matter of principles, not merely as a series of transactions. There are great merchants as there are great statesmen, and there are small merchants as there are small politicians, and the difference between the great and small men is much the same in both. The small politician works by the day, and sees only one opportunity before him; the small merchant does the same thing—he is looking for the next dollar. The statesman, on the other hand, is master of the situation, because he understands the general principles which control events. This knowledge enables him to deal with large questions and to shape the future. The great merchant does the same thing. His business is not a mere money-getting affair, not a mere matter of barter, but a science and an art. He studies the general laws of trade, watches the general condition of the country, investigates present needs, foresees future wants and adapts his business to the broad conditions of his time and place. He puts as much brains into his work as does the statesman, and he ends by being not a money-getter, but a large-minded and capable man. An eminently successful man of the statesman-like quality says that the more he understood life the more clearly he saw that it was all done on business principles, by which he meant not only that the universe is governed by unvarying laws, but that the promptness, exactness, thoroughness and honesty are wrought in every fiber. On these business principles all life is conducted—if not by man, at least by that power which is behind man. It ought to be the ambition of every young man to treat his business from the point of view of the statesman, and not from that of the politician.

Why Should We Not Make Our Own Iron?

TO THE EDITOR:—No industry promotes the commercial prosperity of a country so much as the establisbment of iron works.

California and the whole Pacific slope, including British Columbia, have hitherto been under the disadvantage of being compelled to get their raw iron from the Eastern States, with the exception of a few thousand tons imported from Great Britain. The result is that business naturally belonging to this coast goes to Eastern firms. For instance: two ocean steamers for the Alaska trade have just been ordered from Cramps, whose shipyard is on the Atlantic seaboard, and an undue proportion of the stamp mills, hoisting works and other machinery for the new mines now being opened in the Northwest is lost to San Francisco. In my own limited experience, I know of a Chicago firm now erecting a mill in southern Oregon and another in Washington.

Why should this condition of things exist?

Pig iron costs $10 per ton at Eastern points and $20 per ton here. It is therefore evident that if iron can be made on this coast as cheaply as elsewhere, a very large and profitable industry can be established.

Three attempts have been made to manufacture iron—one in each of the three States of California, Oregon and Washington—and those familiar with the subject predicted, what ultimately happened, that the ventures would fail.

The prime condition necessary to success is that the works be established where suitable fuel is abundant, and if the iron ore and flux be also in close proximity to the fuel, an ideal situation is realized. It is this which has enabled Alabama to export last year 60,000 tons of iron to Europe, and it is the abundance of good fuel in Pennsylvania which, now that the local carbonate ores are nearly exhausted, enables it to import annually 700,000 tons of ore, mostly from Spain, and to use the low grade New Jersey rock containing only 14 per cent of metallic iron concentrated by the Edison process, as described in one of your recent issues, (not a word about the cost of this process is given, and it must be expensive, quarrying, concentrating and making into briquettes).

When it is considered that five tons of ore, coal, lime and other supplies are required to make a ton of iron, the other four tons making only smoke and slag, the advantage gained in saving of freight by having all the raw materials in close proximity is apparent.

About eight years ago a scheme was largely advertised which proposed to erect iron works near Seattle, distant fifty to eighty miles from the nearest ore and fuel. A townsite was laid out and many town lots were sold, but it is almost needless to say that no iron works were erected.

I have been led to make this communication because, in order to get support for the establishment of iron works on an ideal site, with coking coal, iron ore and lime in close proximity, where iron can be made for $8 per ton, and having railway and water communication, I am met with the tale of all former attempts having failed, and further, it is plainly stated, what I can hardly credit, that the transcontinental railway companies are strongly opposed to the making of iron on this coast, as the greater part of their overland freight consists of the products of iron manufacture. My idea is that the railways would reap the main advantage, they being the largest consumers of iron, besides reaping the benefit of the increased traffic always accruing to the establishment of an iron industry.

R. B. SYMINGTON, M. E.

San Francisco, Nov. 30th, '97.

SOME interesting facts in regard to military signaling by telegraph, telephone, balloons, etc., are contained in the annual report of Gen. A. W. Greely, chief signal officer, to the Secretary of War, just made public. The permanent military telegraph lines operated by the Signal Corps aggregate 802 miles in length, exclusive of the short cable in New York harbor. The most important additions during the past year have been in connection with the operations against hostile Indians in Arizona. Gen. Greely says: "The most notable advance is in the development of the combined telegraph and telephone apparatus devised by Capt. James Allen, Signal Corps, which is distinctly superior to any previously constructed, and admirably answers all requirements. An operator can easily carry a combination telegraph and telephone office; and while one soldier telegraphs a message, another may, over the same wire, talk telephonically with another station, the distant receiving operators hearing only their own message. The outfit weighs but sixteen pounds, including battery, has been rigidly tested up to a distance of more than 600 miles, and is a pronounced success in its various capacities as a 'buzz' Morse, telephonic and phonoplex instrument. The importance of this means of communication is not confined to the field work of the Signal Corps, but in its many applications may well become world-wide."

Does Technical Education Pay?

The fact that the different colleges and technical schools are now opening their doors for a new year brings to notice two great changes that have taken place in college education, which have been very noticeable during the past fifteen years, says *Machinery*. These are the increased attendance of students of small or moderate means, and the introduction of engineering and scientific courses which are supposed to be of a more useful nature than those of former years.

While the primary object of any course of study is and ought to be to give a general training on broad lines, the above-noted changes indicate that the majority of those who now go to college hope to receive a certain amount of special training which shall directly aid them in their future work, similar to that given by a medical college, which fits its graduates to a certain extent for medical practice. In short, whatever thought concerning general training the student may have, he wants to know if his studies will pay him in dollars and cents.

As far as mechanical work is concerned, there appears to be a difference of opinion regarding this point; many holding that everything that has been done with or about machinery can be done better, or at least as well, by the man whose mechanical knowledge has been obtained from his own practical shop experience.

It can be stated as a general principle that what brings money is a knowledge of how to do things and the ability to do them. So far as the results are concerned, it can make no difference where this knowledge or ability was acquired. Plenty of men who have come up through the shop have secured it and have been successful, and so have plenty of men who have had a technical education.

The question then seems to be: Where can the knowledge and ability be obtained to the best advantage? We have no hesitation in saying that under the right conditions the knowledge can be best obtained in the technical school and the ability in the shop. In many cases, of course, the obstacles in the way of the former are the expense and lack of preparation, but several schools are already doing much to make it easier for those who really desire to attend them. We should be slow to advise anyone to undertake a course of study when it would be likely to result in a sacrifice of health in the endeavor to pay his way. He had better try to get his knowledge in some other way. Aside from this restriction, we believe a course in mechanical engineering will pay anyone who already has or is willing to get the needed practical experience in addition.

Scientific Progress.

Gold in Mine Timbers, Etc.

Some time ago the MINING AND SCIENTIFIC PRESS was in simultaneous receipt from three widely separated points of inquiry as to the possible existence of gold in mine waters and old mine timbers. The answer was a decided negative. In this regard the following is of interest. It is from a paper of several hundred printed pages in length, entitled "Genesis of Auriferous Lodes," by J. R. Don, at the Chicago meeting of the Am. Inst. Min. Eng'rs. Mr. Don says:

The evidence for the existence of gold in mine waters rests, so far as I am aware, on the discovery of gold (1) in boiler scale from boilers fed with mine water, and (2) in wood taken from old mine workings where it had been covered for some time with mine water—the latter being assumed to have carried dissolved gold into the timber, to be precipitated by the organic matter of the wood. But the finding of gold under such circumstances does not prove that it was in solution in mine waters at deep levels. In the first case, the gold may have been carried into the boiler in suspension, along with the silt which all mine waters contain. In the second case, even though gold may have been dissolved in the water surrounding the old timbers, it may have been brought into such solution by the action of the air in the mine workings, oxidizing sulphides of the rock to sulphates and setting free sulphuric acid, which in turn, acting on the chlorides always present in mine waters, would liberate hydrochloric acid. This acid, acting on oxides of manganese, would free chlorine, which would dissolve gold. This statement applies particularly to all mines the waters of which contain considerable iron. Every sample of chalybeate mine water analyzed by me acted as a precipitant of gold when taken fresh from the workings, but as a solvent of gold at ordinary temperatures, in the presence of the oxides of manganese, when it had been exposed to the air for a week or two.

Mr. Newbery, however, distinctly said, in his testimony already cited, that he found angular quartz which had been soaked up into the timber examined, and that the gold might have been mechanically introduced the same way.

With regard to the suspension of gold in mine waters, the following evidence, obtained by me last year, may be of interest:

In the Long Tunnel G. M. Co.'s mine at Walhalla, Gippsland, Victoria, one of the most productive mines in Australia, the water pumped from various depths, down to about 2300 feet below the surface, is run into two large settling tanks, before using. At the time of my visit one of these tanks contained a large quantity of fine silt, which had been suspended in the mine water. I analyzed three samples of about two pounds each, first panning off the lighter part, and then assaying the residue. The first sample gave 0.0063 grain of gold; the second, no trace; and the third, 0.0175 grain.

These results show that assays of boiler scale do not necessarily prove that gold was dissolved in the water depositing it; and, also, that in all analyses even of samples from the vadose circulation, to test the presence of dissolved gold, care must be taken to free the water beforehand from every trace of suspended matter.

I have tested many old mine timbers for gold. In every case the outside wood was chipped off to the depth of about ¼ inch; and, when cracks appeared in the timber, about ¼ inch on each side of the crack was also chipped off. These parts were burned, and analyzed separately from the inner portions.

The following table shows the results of several such analyses:

Sample.	Description and Locality.	Part Analyzed.	Gold Found.
I.	Prop from the Tipperary Gold Mining Co., Macetown, Otago, much decomposed. The part analyzed had been under water for many years.	Outside of the prop.	None.
II.	Do.	Inside of do.	None.
III.	Prop from an old tunnel in an alluvial terrace, near Skipper's Point, Otago. The part analyzed had been under water for probably twenty years.	Outside of prop.	None.
IV.	Do.	Inside of do.	None.
V.	A prop from the Premier mine, Macetown, Otago. Water had been running over it for two years at least.	Outside of prop	0.0038 grain.
VI.	Rotten wood from the lower part of a rejected prop from the Long Tunnel Gold Mining Co., Walhalla. From a part of the mine where a richly auriferous reef had been worked.	Outside of do.	0.0097 grain.
VII.	Do.	Inside of do.	None.
VIII.	Decayed portion of lath brought up from the deep workings of the Northern Star Gold Mining Co., Ballarat. Had evidently been saturated with water for many years.	No portion was sound; all was burned and analyzed.	None.
IX.	Portion of sleeper used in a tramway, Northern Star Gold Mining Co., much decayed. A large quantity of water had been running over it for at least a year.	No portion was sound; all was burned and analyzed.	0.0129 grain.

The Scientific Advance.

It is astonishing, says *Popular Science*, to look back and see the strides that have been made in eighty or ninety years. In the beginning of the century there were stationary steam engines, and a few crude attempts were being made in the direction of steam navigation; but as yet the locomotive was a thing unthought of. To-day marine navigation has taken the form we see in the giant vessels that ply between this country and Europe and the first-class battle ships of the world's great navies, with their triple-expansion engines, their wonderfully perfected boilers, their twin screws, and their infinitely multiplied appliances for safety and efficiency.

At the beginning of the century electricity was a curious study, giving only slight promise of any useful practical applications. It had not advanced beyond the frictional machine, the Leyden jar, and the voltaic pile. The telegraph was as yet undreamed of, and the telephone and the dynamo utterly imaginable developments. Had anyone dared to conceive that signals could be made to pass in a second of time between Europe and America he would have been considered a fit candidate for Bedlam; and certainly not less insane would have been considered the notion that a human voice could by any device make itself distinctly audible at a distance of 500 or even 1000 miles. To-day these things are commonplaces, and men are beginning to grudge the trouble of putting up wires for the conveyance of the electric current, great authorities in the scientific world having told them that, theoretically, it ought to be possible to do without such crude appliances. What was a curious toy in the beginning of the century is the jack-of-all-work at its close, or, in other words, the most widely available form of force in the modern world. What steam cannot do, owing to the difficulty, on the one hand, of generating it locally, and, on the other, of conveying it to any great distance, electricity, which is capable of infinite subdivision and of distribution from a relatively distant center, stands ready to undertake.

We have only to look around us to

see the innumerable wonders that science in its practical applications has wrought, and to be impressed by the beneficence of its operations. The electric light in our streets and the familiar trolley car constitute additions to human well-being and enjoyment the value of which it would be difficult to estimate, while the telephone has almost revolutionized the industrial and commercial life of cities and towns. Electro-chemistry, again, and photography are two arts the influence of which is at once widespread and penetrating. The former dissociates the elements, isolating those we wish to isolate and leading others to form new and desirable combinations. It has produced what is virtually a new article of commerce in the metal aluminum, previously a rare and expensive product, and in a thousand ways has transformed or modified industrial processes. What photography is to the present age it would take a considerable treatise to set forth. The bookmaker, the traveler, the astronomer, the physician, the analyst, the architect, the biologist, the police agent, the engineer, the microscopist, the military man, the artist, and the representatives of a hundred other crafts and professions would all have to contribute to the tale. By photography we can record successive movements in the impact of a cannon ball and analyze the life history of a lightning flash; we pierce the abysmal depths of space and catch the faintly trembling rays of bodies that no telescope has the power to reveal.

THE Smithsonian Institution has just come into possession of the Haslett Phillips collection of Indian implements and antiquities from the Potomac valley. It is reputed the largest single collection of its class in the world, and its value is greatly enhanced by the careful arrangement and record of individual specimens. The collection consists of over 20,000 pieces, principally spear and arrow heads, stone knives, hammers and scrapers, and fragments of pottery and soapstone utensils. Mr. Phillips has made a life-long study of prehistoric man in the Atlantic tide-water region. In his opinion, which is accepted as authority by the Smithsonian scientists, Washington was not the first capital on the banks of the Potomac. The site, owing to the great advantage in connection with stone quarries and the river fisheries, was the headquarters of the great Algonquin Confederacy, the most powerful of the Indian nations on the Atlantic coast. It was with these Indians that Captain John Smith first came in contact on his initial voyage up the Potomac, and his memoirs contain an account of a fight with the Indians in their principal village on the site of what is now Anacostia, a suburb of Washington.

A. FRENZEL, in Tschermak's *Mineralogical Journal*, makes scientific description of the tellurides of Kalgoorlie, Australia. Sylvanite from Hannan's gave on analysis 58.63 per cent of tellurium, 36.60 per cent of gold and 3.82 per cent of silver, differing in some degree from the tellurides of California and Colorado. The Kalgoorlie specimens are silvery white with a metallic luster and have perfect cleavage in one direction; hardness on the mineralogical scale, 2½; specific gravity, 8.14. An iron black telluride of gold and silver with conchoidal fracture and no cleavage is also found at Kalgoorlie.

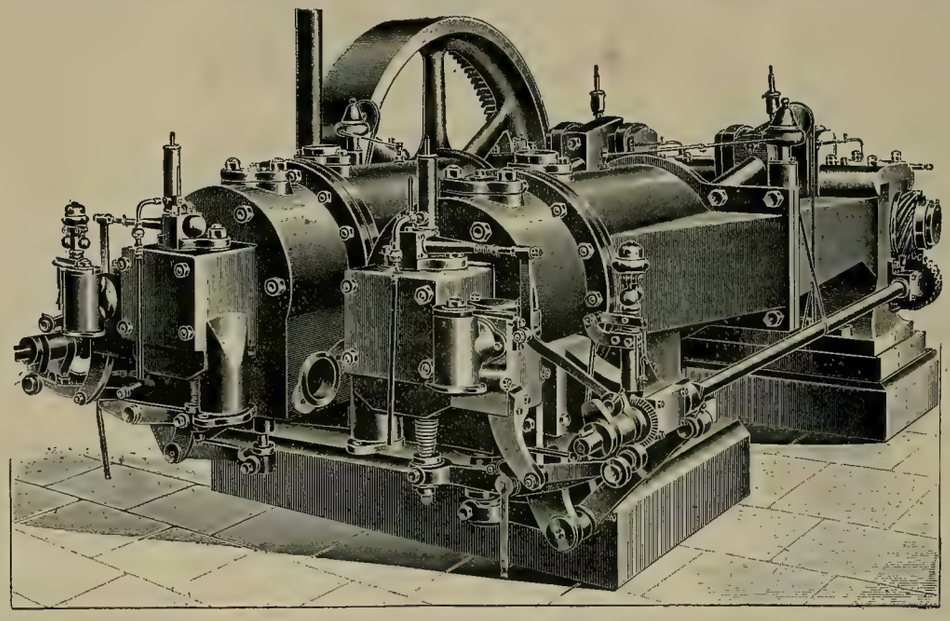
PROF. PETRLIK of Prague describes the application of the Pœtsch freezing process in the sinking of a shaft at Brux, in Bohemia, where thirty yards of quicksand had to be sunk through. The bore holes for the freezing tubes were put down January 15, 1895; freezing began June 1, sinking through the ice on December 2, and the shaft was completed May 15, 1896. The lining, when the shaft had been filled with hot water and pumped out, proved to be perfectly water-tight. Such appliances are of little interest to the Klondike, where the problem is to overcome natural existing conditions similar to those artificially produced at Brux.

Mechanical Progress.

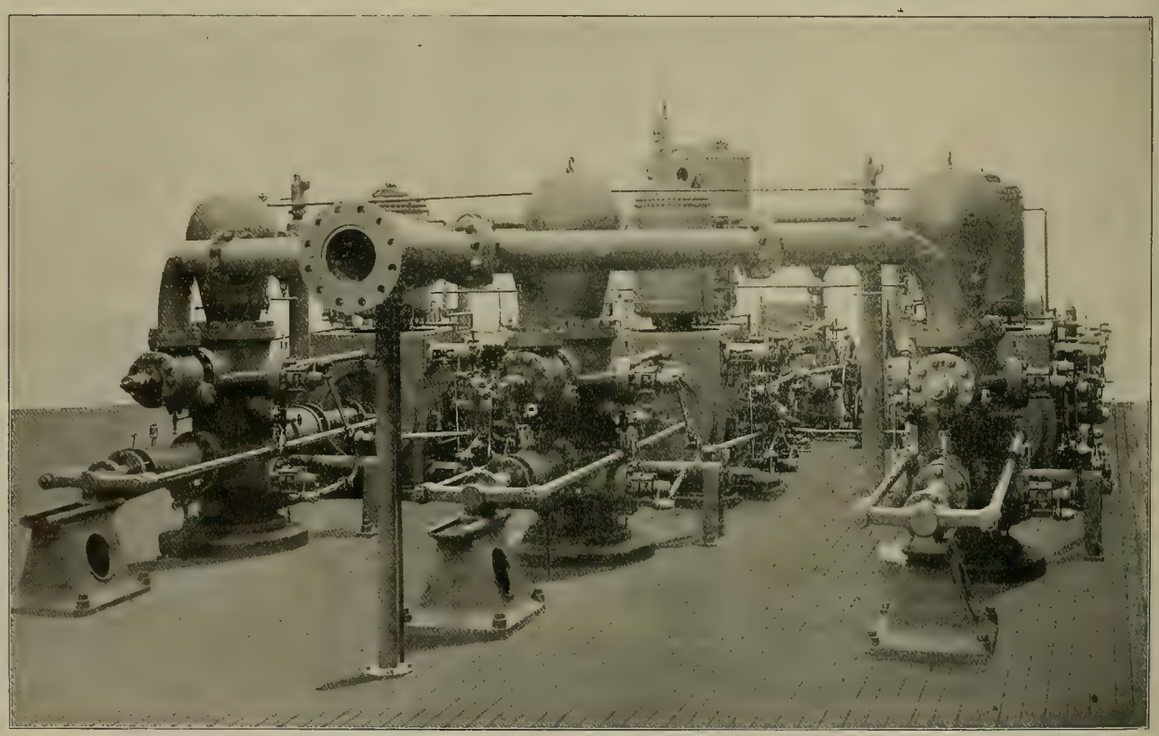
Mining Pump.

The Riedler pump, built by Fraser & Chalmers, Chicago, for the Chapin Mining Co., Iron Mountain, Michigan, is a triplex differential, plungers 6⅞ inches and 9⅝ inches diameter by 30-inch stroke, driven by a horizontal triplex tandem compound condensing Corliss engine, steam cylinders 22 and 36-inch diameter by 36-inch stroke; capacity, 2200 U. S. gallons per minute against a total head of 1700 feet when running about 74 revolutions per minute. It is designed to run economically with steam pressure at engine of 110 pounds per square inch, or by compressed air with a pressure of 60 pounds per square inch at engine. This pumping engine, illustrated herewith, is believed to be the largest underground pumping engine in the world.

At the present time the pump is working on the 1310-foot level and raising 1200 gallons of water per minute, but, later, will be lowered to the 1700-foot level.



A 300 H. P. MODERN GAS POWER PLANT.



RIEDLER PUMP FOR THE CHAPIN MINE, IRON MOUNTAIN, MICH.

A Modern Gas Power Plant.

The London *Engineer* gives an illustrated report of a 300 H. P. gas engine plant, working on the Thwaite patent continuous cycle, part of which is reproduced on this page. The apparatus consists of two large cylinders side by side. The air is supplied by a fan driven from the main engine, and the gas is fed into the hopper at the top. The gas, as it leaves the bottom of the second generator, has a high temperature, and is made to heat the incoming air by means of a recuperator apparatus, thus restoring a considerable amount of heat to the generators. From the recuperators the gas passes through a physical purifier to the pressure governor-holder, which automatically governs the supply of gas to balance the demand, and from which the gas engine receives its supply.

The gas engine is of the duplex type, having two cylinders 16 inches diameter, side by side, the length of the stroke being 2 feet. There is one firing stroke every revolution when fully loaded. The speed is 140 revolutions per minute.

The charge of gas and air is compressed to ninety pounds per square inch above the atmosphere. The engraving shows the teeth of the flywheel into which the piston of the small starting engine gears; this engine is of the vertical type, having a cylinder 6 inches diameter. Both tube and electric ignition gear are applied to the engine. The engine house is covered with a water tank, which feeds the circulating mains of the engine.

Sectionalized Machinery.

Builders of mining machinery are ever confronted with the problem of transportation difficulties in mountainous countries. In North and South America, particularly, Nature's obstacles to the carriage of unwieldly parts of mining outfits have taxed the resources of designers, with the effect of developing a species of "sectionalized" machinery in which every part, in point of weight and shape, has been proportioned with an eye to the carrying capacity of a mule. Engines, pumps and stamp batteries and the miscellaneous lot of other apparatus which make up the modern mining plant are all made

in pieces, which, under ordinary conditions, would not be thought of and would entail useless detail in construction and subsequent erection. To the mine superintendent in almost inaccessible latitudes, however, they have a significance of the keenest interest and importance, and their proper consideration by the builder may make to the mine owner all the difference between smooth sailing and fretful delay and lost money. *Cassier's Magazine* cites an incident in Peru where a company operating there determined to erect a crushing mill, and the chief member of it, a German, insisted on placing the order in Germany. When the machinery, which had been specifically ordered for mule transportation, was unloaded, it was found to embrace timbers 16 by 24 inches, by 24 feet, weighing 800 pounds. This was destined to go by a trail which led over the *cordillera*, at an elevation of 16,000 feet to a *quebranda*, on the other side 7000 feet lower, over which no mule could carry more than 300 pounds, nor any piece longer than 6 feet.

A similar case was reported from Mexico, where a stamp battery, timber and all, had been sent out from England. It was to be erected for an English company, and the order had been placed with a home manufacturer by the London office without consultation by the officers at the mine. The mine was ten freighting days from the railway terminus, without a vestige of a wagon road, and at last accounts the local officials were still puzzling their brains as to how the main battery frames were to be transported to their destination.

Blasting Coal by Hydraulic Process.

On account of the many dangers attending ordinary methods of blasting in coal mines, a safer process of loosening the coal has long been a desideratum. Such a device—a new hydraulic apparatus—has lately been exhibited before the Manchester (England) Geological Society by James Younge, the inventor, and its merits explained. The apparatus consists of a hydraulic cartridge, 18 inches in length, 3 inches in diameter, and weighing thirty pounds; also a small but powerful hand pump, fitted with a pressure gauge of about twenty pounds weight. In using it the coal is holed underneath to the usual depth, and a hole drilled near the roof to about the same depth as the holing, in the same way as for blasting, after which the cartridge is placed in the hole and pushed to the back; no "stemming" is required. The pump is coupled to the cartridge, the suction pipe is placed in a small bottle of water, and work commences. Very soon the gauge begins to show the rising pressure—half a ton, a ton, a ton and a half, two tons, to the square inch.

During this time a cracking sound is heard, indicating the shearing off of the coal at the back. The gradual way in which the work is done, without shock or jar of any kind, prevents even the least damage to coal or roof, in striking contrast to the action of explosives. The time occupied is rated at twelve minutes—this including the placing of the cartridge in the hole, connecting the pump, getting down the coal, withdrawing the cartridge from the hole, and getting to the next place.

WINANS' cigar steamers, famous a generation ago, which have lain idle in Southampton water for the last twenty-five years, are now to be broken up and sold for old iron. They represent quite a large and entirely inert investment, and no further experiments in marine construction on the principles which they embody is to be looked for. They will always rank among the curiosities of shipbuilding, and stand as a sign that the experimental millionaire and his money are sometimes speedily parted; but they possessed no fitness for the function designed, and had not enough "go" in them even to find their way to Davy Jones' locker, so they will go to the scrap heap instead.

Electrical Progress.

The Niagara Falls Transmission Line.

The power transmission line from the Niagara Falls power house to Buffalo is now undergoing a considerable increase, the demand for power from Buffalo having within the past few months grown beyond the capacity of the line first put up. The three wires strung on the poles will shortly have three companions, and the white insulators on each pole will be increased to six.

A new order for cable as well as for transformers has been placed with the General Electric Company. The cable is of special manufacture, is insulated to stand the ultimate pressure of the line, which will be 22,000 volts, and is tested under a considerably higher pressure before leaving the works. There will be used at first 24,000 feet of this cable for that part of the transmission line within the city of Buffalo. The order for increasing transformers covers seven of similar size and design to the three already installed in the transformer house of the Niagara Falls Power Company. These ten transformers are the largest ever built. Each has a capacity of 1250 H. P., making a total step-up transformer capacity of 10,000 H. P. They are of the air-blast type, and will stand in rows of four upon the air-tight chamber, whence the air is forced through the ventilating spaces in the transformers. It will be remembered that the two-phase current at 2200 volts passes from the 5000 H. P. generators in the power house to the transformers. In these it is not only increased in pressure, but changed in phase, the current issuing from the transformers' three-phase current at 11,000 volts. This pressure will be adopted until it becomes necessary to increase it, when it will be doubled and be delivered to the transmission lines at 22,000 volts. On its arrival in Buffalo it will be delivered to the step-down transformers of the Cataract Power & Conduit Co., which controls its distribution there. The electricity will be transformed down to different pressures for distribution over a city network to different points for a variety of purposes, being used directly in induction motors, a number of which will probably be installed in grain elevators, etc.

Several step-down transformers will also be placed in the station of the Buffalo General Electric Company, and from these the three-phase current, converted into direct current in rotary converters, will be utilized for lighting purposes and for small power units.

The Buffalo Railway Co. is also increasing its step-down transformer and rotary converter capacity in its Niagara street power house. In addition to the two 500 H. P. converters already in operation, the General Electric Co. has built two others of similar capacity and construction. These will bring the total converter capacity in the station up to 2000 H. P. To supply these necessitates the installation of three additional step-down transformers in the transformer house between the station and the canal. These will be of about the same capacity as the three already there—each of 275 K. W.—reducing three-phase current from about 10,500 volts to 375 volts for delivery to the alternating current side of the rotary converters in order that it may issue direct current at 550 volts, at which pressure it is delivered to the bus bars of the station switchboard.

REPRODUCTIONS in hard steel of objects in low relief, such as medals and electrotypes, are obtained by a German electrician, Herr Josef Rieder, by a simple electrical process, forming a short column, which is detached and fitted with an ebonite sleeve, leaving the top and bottom alone exposed. The cast is placed face upward in a vessel containing an electrolyte. The piece of steel to be etched is laid on the face of the cast—which projects above the surface of the liquid—and made the anode of the cell, the cathode being a wire spiral placed in the liquid. A moderate current of considerable voltage suffices. The current passed through the high parts of the cast dissolving the steel and allowing it to settle until a complete copy of the original surface is obtained. Difficulties are the softness of the plaster and accumulation of carbon from the dissolved steel.

New Use for Magnets.

In the plate mill of the Illinois Steel Company a new use is found for magnets. All know from experience that a magnet will attract cold steel, but few have ever thought of magnets lifting red-hot metal, yet this is done hourly at the plate mill of this company. Their magnets will lift five tons of red-hot steel, not only that, each magnet will pick up half a dozen large steel plates and drop them one at a time with the regularity of clockwork. So cleverly and quickly do they conduct themselves that they seem endowed with almost human intelligence. It is truly marvelous the way these pieces of magnetized steel pick up the steel plates that would require a derrick to hoist under any other circumstances and place them in the desired spot as easily as one would pick up a dime and place it in his pocket. A keen-witted electrician solved the problem of operating these magnets so the plates could be dropped one at a time. Of course, it was not desirable to pick up a half dozen plates and throw them down in a heap somewhere. The system required that one plate at a time should be taken care of. The electrician in the case made a study of the matter, and soon became expert in operating the switch. It came to him one day just what ought to be done to bring the magnet up to the one-plate standard. So, after the magnet had taken up several plates, he pulled the switch out, thereby breaking the current for an instant. He found that by this operation one or two plates could be dropped off at each breaking of the current, the plates next to the magnet retaining sufficient magnetism to hold them to the steel of the magnet itself until the current was again switched on. This operation was repeated until only one plate remained attached to the magnet. A great many concerns have been afraid to put magnets into use on account of the apparent danger of dropping the material, and thus endangering the men who might be at work. But the company supplying them say that in years of experience they do not know of a single case where anyone has been injured by the material dropping, and they firmly believe that it is the safest way possible of handling certain classes of iron and steel. The magnets are so designed that it is impossible for the men who are placing them to receive a shock. Inventive genius is making it more and more possible to work with this powerful factor and not receive the slightest injury. Electricians who have studied this matter say that this is the beginning of a new era in the appliance of electricity to mechanical purposes, and when the fact is demonstrated that this force can be used in perfect safety, electricity will find fields of usefulness in directions apparently barred to it at the present time.

Large Electrical Transformer.

What is described as the largest electrical transformer in the world for commercial use has just been completed at the Westinghouse Electric & Manufacturing Company's plant at East Pittsburg for the Niagara Falls electric power plant. The transformer will have a capacity of 100,000 volts, and its successful construction is remarkable from the fact that electricity at such a pressure is a near approach to lightning. The transformer will be used for testing the effectiveness of insulation on the great cables to be used to convey power from Niagara Falls to Buffalo for the operation of the traction system there. The pressure to be used in carrying 10,000 horse power to Buffalo will be 20,000 volts, the volume being decreased and the pressure being increased from 2000 volts in a transformer at the dynamo. This is done so that the great H. P. can be carried a long distance on a small copper wire, rendering economical operation possible. To carry 10,000 H. P. at a voltage of 2000 would require a cable six or more inches in diameter, while that to be used will only be two-thirds of an inch in diameter. The great difficulty, however, was in securing insulators that would prevent the electricity from jumping from one wire to another, the sparks at such a pressure reaching ten and twelve inches. This was the main problem in the construction of the big transformer. Two months were spent designing and making the instrument, and in tests now being made it acts satisfactorily. Generally speaking, the two coils in the transformer are separated by fifty or more sheets of specially prepared paper soaked with insulation varnish. The wires are carefully wrapped and the whole is immersed in oil. The wire used is only of the diameter of a darning needle, and even with the high voltage the possible H. P. equals 40. At such an enormous voltage the wire is luminous, and destruction by the leaping sparks is an unusual feat to prevent. Already on the 20,000 voltage Buffalo line several poles have been burned down by sparks at broken or defective insulators. The voltage is decreased to 2000 again at the traction plant.

THE conversion of the capitalist is the most significant achievement of the modern electro-chemist. Not many years ago electrolytic processes were regarded by those who were at once enterprising, opulent and sane as sinks for surplus cash. Without giving unqualified consent, one may admit that this view was at least tenable. It is, of course, obvious from the purely technical standpoint that the chief use of the capitalist is to embark in new enterprises which are too risky and expensive to be practicable for men of modest means, and that his failure and ultimate commercial extinction are mere incidents in the march of progress. The present situation of electro-chemical industry may be summed up thus: The refining of copper is a thorough success, and its ultimate predominance is assured; the winning of zinc is about to come; the aluminum industry is on a firm and broad basis; sodium can be made cheaply, but wants buyers; soda and chlorine products are just rounding the corner, and their manufacture is being seriously undertaken; the co-operation of the capitalist in all reasonable enterprises has been secured. There has been much solid progress, and we may fairly look for further and substantial advances in the near future.

THAT electricity is a progressive science needs no proof, and the rapidity and the extent of its daily growth is astonishing. The vast number of people interested in the various branches of its commercial and scientific application is forcibly illustrated by the number of journals devoted exclusively to electrical topics, there being no less than fifty-eight of these, while there is an equal number of allied journals that treat of the new developments in special fields. Of the electrical journals, fifteen are published in France and eleven in the United States, while the balance are scattered all over the civilized world. With these facts in mind the difficulty of the electrical engineer in keeping thoroughly posted on the developments of his art may be appreciated.

DR. CARY T. HUTCHINSON at a meeting of the New York Railroad Club said that in his opinion the time was not ripe nor conditions suitable for the application of electricity to heavy railroad traffic. The chief conditions for economical electrical service is that the train service shall be frequent—that is to say, that the machinery, including the copper feeders, be always kept loaded, doing work to its full capacity nearly all the time, instead of two or three minutes out of the hour, as would be the case were an attempt made to run the present trunk line service with electricity.

Mining Summary.

CALIFORNIA.

Amador.

The Baliol mine is mining and milling at a cost of 85 cents per ton. By increased milling facilities, the owners expect to reduce the cost to 50 cents per ton.

Record: At the South Spring Hill Con. the shaft is down 1200 feet and a crosscut is being driven to the vein.

At the Wildman the shaft is down 1300 feet, with a vein 3 to 75 feet wide. The Wildman and Mahoney are in charge of a thorough miner.

On the Central Eureka the shaft is down 950 feet.

The South Eureka is 1250 feet deep on a vein of from 5 inches to 15 feet, 20 stamps. The company is about to change to electric power for the mill, blower and crusher.

Ledger: The Live Oak, operated years ago by Parker & Thomas, has been reopened by Young & Sullivan. They sunk a new shaft to water-level ore. They are running a drift on the ledge.

Butte.

A circular letter which has been addressed to the shareholders by the secretary of the Consolidated Gold Mines of California states that "the ore already in sight is estimated at upwards of 250,000 tons, which is sufficient to keep the new 40-stamp mill running for five years or more. The general average of the ore, after discarding all rich assays, is taken at $4.33 per ton, and the manager says that the working expenses, including mining and milling, will not exceed $2.25 per ton."

C. W. Reed has bonded the Parsons mine, near Robinson Mills, and will sink a shaft 100 feet. If the ledge holds out, he will pay $2000 for the property; if not, it will revert to its present owners.

Gridley *Herald*: W. H. Rinehart reports that he has discovered a quartz vein on the North Butte, near Pennington. The ledge is about 3 feet wide.

Calaveras.

The following is a condensed report of the meeting of the Drake Properties, L't'd., at 64 New Broad St., London, on Nov. 19. Chairman C. Bingham said: "You are aware that we have acquired a huge property in California, 821 acres, practically right on the heart of the mother lode—a lode which is stated by our engineer and by other eminent experts to be in all probability the richest and most extensive auriferous formation that the world has ever seen, not even excepting the well-known Witwatersrand formation. The three chief lodes, or, rather, the three chief reefs, or ledges, as we call them in California—the Utica, the Blind or East Ledge and the Dead Horse ledge—practically traverse the south portion of our property. One of them, in fact—the Dead Horse—has an outcrop length in our property of no less than 4000 feet. The Utica reef, which from the map would appear only to touch one corner of our property actually passes into it, and has a great length in our property at a comparatively small depth. One of the considerations which led us to acquire these properties was their proximity to the famous Utica mine. We know very little about the Utica mine—that is we know very little accurately—because the owners of it are private individuals, not a company, and it seems to be extremely difficult to get them to impart any information whatever. Some experts put the profit made by the Utica people in the last four years at £240,000 a year. That is the lowest estimate. Other experts, including our own engineer, say that the profit last year exceeded £400,000. That last estimate is in all probability nearer the truth than the one I named first, because it has been testified to in open court, in California, by one of the proprietors. At any rate, gentlemen, we know as an absolute fact, that the Utica people possess one of the largest milling plants in the world. Taking the great weight of the stamps into consideration, it probably has the largest output in the world. That shows, of course, in the clearest possible manner—especially as I understand that those stamps are running day and night—that the Utica Co. must have an enormous reserve of payable ore. But that is not the most favorable point as regards our property. Lately the Utica people have been sinking a new shaft, and that new shaft is placed practically as near the boundary of our property as the Utica people can well get. They have apparently had the best results from that new shaft, for Mr. Meyer writes in his last letter but one that they are actually putting up another huge mill, making the third mill on that small property—that is small as compared with ours. I would like to read you an extract from a letter dated Oct. 11, which Mr. Meyer wrote me personally respecting this Utica shaft. This is what he says: 'The result of my new examination (he has been making a fresh examination of our property generally) is as favorable as the former one, and my plans will show you that we have reason to place absolute confidence in the future. I am also endeavoring to obtain exact information respecting the underground workings of the Utica; they should not be far from the Ghost shaft, for the reports of their shots are felt in the Ghost shaft with extraordinary force. The bottom of the shaft seems to shake, and the ventilating pipe, which goes down to the bottom of the shaft, throws up a puff of air to the surface every time a shot is fired. The sound always seems to come from the east, never from the west. All this agrees with my observations respecting the strike and underlie of the veins we have to cut. The Utica is making preparations for putting up a new stamp mill at the mouth of the new shaft. It is in this part, close to our property, that they find the richest shoots of gold. There is no doubt whatever of the increasing richness of the Utica lode as it goes towards the southeast.' Mr. Bingham proceeded: "We were thrown back a considerable time—in fact, about two months—by the protracted negotiations which took place between the American vendors and ourselves. I will refer to that later. That has put our engineer a little out in his calculations, but I am very glad to say that he has shown such enormous energy since he started work that he has already nearly caught up to the two months, and if he goes on at the rate he mentions in his last cable he will undoubtedly overtake his estimate long before he is due to cut the reef at a depth of about 600 feet. This is what he cabled the day before yesterday: 'South shaft: We are now drilling 4 feet per day; the rock is slate quartz with sulphurets; in the Ghost shaft we are now making preparations to commence hoisting water; the conditions are very favorable for cheap working.' At the present moment he is sinking no less than 4 feet per day. In his original plan of campaign, he said that he hoped to be down in the south shaft 450 feet on June 1st—that is, practically, six months from to-day—whereas, if you calculate what 4 feet per day means for say, 115 working days, you will come to the conclusion that, on June 1st, he will not be down 450 feet, but something like 700 feet. That, practically, explains the situation, as far as we have progressed, up to the present time. In the Ghost shaft Mr. Meyer is now at 400 feet. The new equipment is being put up and is nearly ready, as you will see from the cable; so that in a few days sinking will be going on vigorously in both shafts, and as Mr. Meyer himself writes, 'the really interesting part of the work will commence.' I should just like to mention that in this mine we are not going for high-grade ore; of course, we shall be pleased to have some high-grade ore if we get it, but we are not anticipating it. We are anticipating a large body of medium-grade ore, and as the costs of working in California are probably very much lower than in any other part of the world, medium-grade ore, if we get it in anything like the body that they have in the Utica—and I think, gentlemen, there is every reason to anticipate that we shall—will pay extremely well. I referred just now to the delay in the negotiations about the acquisition of the property. The Americans did not trust us. They had seen in an adjoining property how people came over from London, promised to find capital, acquired for that promise (and for that promise only) a third share in the property, and then simply let the matter slide, so that they practically got a third interest in the property for nothing. That, I understand, has been done repeatedly in California; so that, while we on one side will not trust the Americans they seem to have some justification for not trusting us. That made our negotiations rather difficult, and at one time we were on the point of breaking them off. Fortunately, however, as they began to realize that they were dealing with respectable and substantial people, we got one concession after another made, and in the long run we succeeded in getting practically everything we wanted. We have now made a contract for the acquisition of those properties which is eminently satisfactory to your board, and I am pleased to say is quite satisfactory to our shrewd and very careful lawyer, Mr. Francis. I think, however it is due to the American vendors to say that with that slight exception we have found them all along the most satisfactory vendors we could possibly have to deal with. I have some little experience of mines, though perhaps not so much as my co-directors, but they say the same thing as I do—we have never yet had to deal with any vendors from our own colonies or elsewhere who have met us as these vendors have done. They have practically sold to us a very large mining estate, which we think is very valuable, on which they have spent over £4000 themselves. They have sold us that estate for paper only; we have not paid them one cent in cash. That shows in a great measure the confidence they have in their own properties. But, in addition to that, they have actually subscribed no less than £5000 of the working capital of the company. I think it would be utterly impossible to show your belief in your own property in a more satisfactory manner than that. I would like to read you one or two words that the chief vendor, Mr. Drake, wrote me on this subject. He says: 'I believe the property we have turned over to the company is even more valuable than Mr. Meyer has reported to you. If you and your associates will not be in too great a hurry to realize on your investment, it will make you more money than you dream. Do not think from this opinion that I am an enthusiast. If the stock is held in a few hands, and if the Tryon tract is properly developed, it alone can be sold for double the par value of the capital, thus leaving the Garnett tract, which is even richer than the Tryon tract. The Harwood and Reidell tracts present a little different features, but I believe are equally valuable. Knowing these facts I may have been a little too particular on what terms I relinquished control of the property.' Well, gentlemen, I can only say that I hope Mr. Drake will turn out to be a true prophet. Mr. Meyer has been so successful hitherto in the management of this company that for the first time I believe on record we actually have a report showing that the expenditure up to date for the machinery, for the work—for everything, in fact—actually something like 20 per cent below the estimate that Mr. Meyer made. My experience has always been that the reverse is the case. If a man estimates so much it is usually 50 or 100 per cent more. In this case Mr. Meyer is so much below his estimate that he has saved a considerable part of his salary already, and that gives us the hope that his estimate, amounting to £15,500 for proving and equipping this mine, exclusive of his salary and the salaries in London, will turn out to be a correct forecast."

At Sheep Ranch the Round Butte gravel mine has twenty men employed. Preparations for hydraulic work, as soon as water comes, is being pushed. It is locally reported that H. F. Butternut & Co. last week found a nugget on the San Antone ridge which weighed 54 pounds 9½ ounces.

Prospect: The Mountain King, owned by Womble Bros., Big Seven owned by W. J. Lewis, and Homestead owned by McCarty and Womble, near Copperopolis, Madam Felix mining district, were bonded last Saturday to a Chicago company; terms of the agreement are that work shall commence within sixty days, a 20-stamp mill erected within six months. These properties have been considerably developed and the ore showing is very good. On the M. K. there is a shaft 270 feet; one of the conditions of the bond requires that this shall be sunk 230 feet deeper, making 500 feet. On the Big Seven the shaft is 110 feet, The Homestead has three tunnels—275 feet, 65 feet and 40 feet.

The shaft of the Pine Log near Copperopolis has reached 700 feet and sinking continues, while ore is being stoped from all the levels to keep the 20-stamp mill in motion. The sulphurets, of which there is a good percentage, is shipped to the Selby Smelting Works in San Francisco. D. Juttin is Supt.

El Dorado.

(Special Correspondence).—The Selby M. Co. (Incorp.) are progressing rapidly in their development work on the old Larkin Ranch, three and one-half miles south of Placerville. The shaft is 225 feet, and crosscutting has reached 40 feet on this level, both east and west. Drifting has been prosecuted north and south on five ledges. The ore body is 60 feet wide, of a medium grade. There are three claims in the group. The property (owned by San Francisco people) is "squarely" on the mother lode. W. Larkin is superintendent and V. Neale president of the company.

The Harville, adjoining the Selby on the south, has four claims, and is controlled by San Francisco and Eastern people. The company expects to sink 500 feet (by contract) before crosscutting.

Eastern men have taken hold of the Stillwagon and Rosebud mines near Fairplay and are developing them.

The tunnel on the Mulkey & Spreckels property is nearly finished, and the old workings will be reached in a few days.

Kern.

Application for a patent is made for the Good Hope mine owned by G. B. Kinyon, located in the town of Randsburg.

Ore running nearly $1000 to the ton is reported in one of the shafts of the Rademacher mine. This is the first mine located in that part of the desert.

In the Stringer district, near Randsburg, there are fifty dry washers at work; in the Pumpkin Roller district and Goler as many more are taking out pay dirt. In the Stringer country dry washers are averaging about 12 cents per run of fifty shovels each. Twenty to forty runs are made in a day.

The *Miner* hears that the officers of the Kramer-Randsburg Railroad are figuring on putting up a 40-stamp mill, with concentrators, at Barstow, and that it is proposed to give a cheap rate for ores, so that it will be possible to haul and mill the ores at a price not to exceed $4 per ton.

Mariposa.

(Special Correspondence).—On the Flyaway group E. C. Loftus is putting down a two-compartment shaft; he will go down 300 or 400 feet and thoroughly prospect the property. The storage dam at the Virginia will be completed in about a week and some progress has been made on the new mill. The Daisy tunnel at the Red Banks is nearing the 900-foot mark and it is thought the ledge may be cut at any time. About three weeks ago it was stated in these columns that the Merced Co. had struck a body of high grade ore in the Mary Harrison. The directors of the company authorized a denial of the report which was published in two Boston papers. The accuracy of the statement is proven by the fact that recently at Coulterville the company caused the arrest of two miners charged with stealing ore from the Mary Harrison mine. Several hundred pounds of ore, alleged to be worth about the same number of dollars, were seized at the time of the arrest, and are claimed by the officers of the company to have been taken from the workings of the Mary.

Mariposa Dec. 6th, '97.

The following is clipped from the News Bureau of the 3rd inst.: "Plans are under way by which friends of the Merced Gold Mining Co. will advance the company about $60,000 at 6 per cent interest for development of the property. It is proposed to resume sinking of the Mary Harrison vertical shaft and to connect by levels with the old incline shaft. While the condition of the mine is sufficiently encouraging to induce friends of the company to advance this money, it is not thought best as yet to levy a $3 assessment. In the 600-foot level of the Mary Harrison shaft some good ore has been found. Of three assays made the results were $14, $225 and $9 to the ton. The latest mill returns showed a little over $5 to the ton. The company has some 60,000 tons of ore blocked out which should pay a profit of $1 per ton. If results of new workings are satisfactory an assessment of $3 per share may be levied and an electric power plant established. People close to the management believe that the mine is capable later of earning $300,000 per annum."

Nevada.

Underground work at the Bellefontaine mine, in Willow valley, has been suspended pending construction of a new 5-stamp mill.

The Chinese companies which have been hydraulicking for several years at Omega are adopting the elevator process, which they have in course of construction.

The monthly production for the past year of the Delaware gravel mine, Nevada City, has been $15,000 per month, says the *Transcript*.

It is said that tributers who have been working at the W. Y. O. D., Grass Valley, for a long time have realized $4 per day.

The Black Oak, above Moore's Flat, is being developed by the California Mutual M. & D. Co. A new tunnel is being run for the ledge, which showed well in the shaft from the croppings.

The incline on the Milliken Ranch gravel mine is 600 feet and the drift north is 260 feet. Poorman & Hastings expect to tap the Harmony channel within 100 feet. A. Durbin is superintendent.

The Phœnix Company's reservoir is completed; it is 100 feet long by 50 feet wide and 10 feet deep. There is a fall of 500 feet from the reservoir to the mine. As soon as the workings are dry exploration will be commenced.

The lessees of the Eagle Bird mine, Maybert, started their mill last week. The ore is of a promising nature.

Good rock is being taken from the Orleans at Grass Valley. A favorable strike has been made in the 800 level rich in sulphurets.

The copper mine at Spenceville is in active operation, shipping 200 tons of ore daily to the Stager Chemical Works in Alameda.

The Nevada City Board of Trade has unanimously voted to co-operate with the county supervisors in making a display of the gold ores of Nevada county at the Golden Jubilee Fair to be held in San Francisco next month.

Herald: Suit has been begun in the United States Circuit Court by F. Williams, as trustee, against the Gold Hill M. Co. and others to foreclose a mortgage given in 1890 to secure an issue of $50,000 in bonds. The property mortgaged includes the Nevada City quartz mine and other property in Nevada county.

Telegraph: Work was started on the Sauvee, between the W. Y. O. D. and the Pennsylvania. The mine has been called the Golden Treasure. Capitalists from San Francisco and Los Angeles will handle the property. Work began cleaning out the tunnel. The shaft will be pumped and crosscutting commenced. The mine is owned mostly by F. Dulmaine.

Union: On the Widbur mine the new shaft is down 150 feet. A 30-inch ledge of paying rock has been struck, and another of 4 feet was also encountered. J. Deasy is superintendent.

A recent crushing of forty-three loads of ore from the Wisconsin at Grass Valley yielded the sum of $25 per load.

Placer.

The Pioneer has made a survey for a new tunnel on the 1500-foot level. The foundation for the twenty additional stamps has been ordered, and it is expected a chlorination plant will be erected.

The cleanup after a month's run at the Gold Blossom mine, at Ophir, aggregated over $10,000. The mine has forty men at work, is running ten stamps at present, and will have twenty more at work soon.

Plumas.

At the mouth of Mill Creek two Frenchmen are taking out considerable gold.

The Rappahannock has shut down for winter.

F. Eyraud is working on Stoney Bar, and is taking out a little gold.

The Cooley Bros. on Smith's Hill are sluicing and making good wages.

H. and J. Batty are mining on Willow Bar, meeting with success.

Riverside.

The G. C. M. Co. organized at Riverside. D. E. Mitchell, Pres.; E. B. Fish, Vice-Pres.; C. C. Doran, Sec.; First Nat. Bank, Riverside, Treas.

The company will operate the Gold Canyon mines, Riverside county. They consist of two claims, 3000 feet, a ledge averaging 7 feet in thickness. Two tunnels have been run on the vein, one 90 and the other over 300. The ore shows well, the poorest milling $10 per ton. The company will erect a 10-stamp mill. The ore is free milling.

San Bernardino.

Los Angeles *News*: The strike in the Rose mine in San Bernardino county, fifty miles from Victor, at the 800 level, is said to be 4 feet wide and assays well.

San Diego.

(Special Correspondence).—In the Julian district work is to be resumed on the Cincinnati Belle. Report says a cyanide plant is soon to be put in at the Stonewall mine for working the tailings, which have been fully prospected. It is anticipated $100,000 will be recovered. About twenty men will be employed. The Mountain View Mining Company is continuing work on its property on the backbone of the ridge running north from the Stonewall towards the Ranchita. It is taking out and sacking some fine ore. Work on the Laguna Mining and Milling Company's property in the Laguna mountains is temporarily suspended. Mining interest and prospecting in San Diego county is more active than ever before.

The Golden Cross mines at Hedges have passed into possession of the Free Gold M. Co., which among other capitalists includes I. Trumbo of Utah and California. Litigation has been settled. The purchase price and attorneys' fees amount to $250,000.

(Special Correspondence).—A rich strike is reported in the Helvetia mine, near Banner, which until recently has been lying dormant.

Men are at work on the Cincinnati Belle. Ore is being hauled to the company's 10-stamp mill at Banner.

W. R. Farnsworth is at San Diego from Banner with nuggets from the North Star mine, near Banner, believed to be on the same ledge as that of the Ranchita mine.

At Fallbrook the miners in the Defiance mining district have completed a road which joins the railroad at Murrietta. It is expected the smelter will be in operation Jan. 15th.

Shasta.

Some interest has been created at Iron Mountain by the reported discovery at the headwaters of Slick Rock and Spring creek of

a body of ore assaying $150 per ton in free gold. The width of the vein is reported as 2 feet. About twenty locations have been made on Government section 23. Mine Superintendent Wilson, Mine Foreman Thompson, Asst. Supt. Nourse, members of the company's staff, company railroad employes and other attaches have located claims.

The twenty stamps of the Texas Consolidated are again crushing ore. A test will shortly be made of an electric drill.

Forty men are employed in the Roberts mine, Harrison gulch, Ferdinand Hurst manager. There are 10 stamps and a cyanide plant. Captain Roberts will soon double the capacity of his mill by adding 10 more stamps.

At Hall City W. R. Hall has closed down his mill for the season after a successful run. He will continue taking out ore during the winter.

Twenty tons of ore shipped to the Keswick smelter from the Mt. Shasta mine netted from $40 to $90 per ton.

Sierra.

A mining company was organized last week at Downieville. A. Costa was elected president, J. Latrielle treasurer, C. Meany secretary, T. Costa general manager, O. Nessler superintendent. The mine was named "The All Nations."

Hardly any rain has fallen as yet, and it is thought shortage of water supply will considerably reduce the output of gold in this and adjoining counties.

Siskiyou.

The mines at work, Scott Bar, are Walker & Russell, Schuler & Co., Smith & Maxey, Monroe & Woolridge, Martin Andrews & Co., Hunt & Nesbitt and McCauley & Co.

Work has been temporarily suspended on the Mabel, the Columbia, the Gumboot and the Quartz Hill mines.

C. L. Payton & Co., Yreka, have leased the Commodore mine, and will develop it on an extensive scale.

R. S. Lenhart, superintendent for the new company owning the Gold Ball mine at Salmon river, intends to continue working this winter.

Journal: The Distlehorst & Barton Klamath dredger is working at Horse creek and is reported taking out pay gravel.

At the Blue Gravel, on Greenhorn, they have commenced to take out gravel. The rain of the past two days has furnished plenty water.

Most of the placer mines in Siskiyou are starting, as the late storms have furnished plenty water.

Trinity.

The Brown Bear at Deadwood shipped 58,000 lbs. of sulphurets to San Francisco last week.

It is estimated that the La Grange Hydraulic M. Co. people have spent, or will have spent when the work is completed, $1,000,000 in development work and improvements. The newer work, such as the flume, siphon line, tunnel, etc., has cost in the neighborhood of $500,000. The company's flume is eleven miles in length, requiring 3,000,000 feet of lumber for the construction. But three giants are operated at a time. Steel cables are swung across the diggings, and to these are attached travelers fitted with platforms which are lowered to the bed, loaded with boulders and then hoisted, moving to wherever desired. Water power is the motive force.

Tuolumne.

The Tuolumne County Water Company's flume, which has been shut down for ten weeks, was opened on the 8th inst. The dam of the storage reservoir, about twenty-five miles from Jamestown, washed out some time ago, and the stamp mills had to depend entirely on the streams for water. For over two months many of the mills have been shut down, but will resume work at once.

The new 20-stamp mill at the Gagnere is under way. Over a mile of pipe will be used to furnish water power for the mill and hoisting works. Supt. W. G. Long intends to have the mill in operation January 1st.

At the Norwegian a rich strike is reported.

At the Santa Ysabel a great deal of prospecting work has been done, principally at the 200-foot level, from the different shafts, but at No. 2 shaft on the Mascot vein, development is being carried out at the 300-foot level. At No. 3 shaft is developed the Knox and Boyle ore chute 700 feet on the incline of the vein; this ore chute was worked formerly to about 400 feet on the incline, yielding a high grade of ore. It faulted at this point and was in consequence abandoned by the former owners. The present owners sank 200 feet farther on the incline and found the ore chute again, through which they drifted 80 feet; sinking another 100 feet on the incline they again found the ore chute and have drifted 50 feet, still holding good ore in the face. Near No. 2 shaft they also discovered the Mascot ore chute, which carried good ore continuously for over 300 feet at the 200-foot level; the stopes above this level have not been as regular as expected, the ore being pockety, but on sinking to the 300-foot level they have again found the ore of better appearance than at the 200-foot level, and are now drifting on it to learn its extent. They have also between No. 2 and No. 3 shafts at the 200-foot level the Central ore chute, which showed very well, and are now cutting under it on the 300-foot level and find good ore in the drift. In doing this extensive prospecting to determine the location of the ore chutes and in erecting mill and power plants, they have contracted a debt of about $80,000 to date, which has been carried by the trustees who have voted to call a meeting of the stockholders to authorize an increase of the capital stock by 30,000 shares.

Independent: Rich ore has been found in the Confidence mine in the old workings. The property is owned by San Francisco people. O. S. Buckbee is the new superintendent.

Supt. Fisher of the Lady Washington is making arrangements for the erection of a 10-stamp mill.

The Tuolumne Co. M. & D. Co. of Fresno has acquired the Sell, Barenda, Columbus and Hughes mines.

A rich strike is reported in the Marble Point, operated by J. Joseph. This is a new property.

Yuba.

There is great activity in mining about Brown's Valley. The Pennsylvania is turning out good rock and the ledges are developing in size.

NEVADA.

The Molus mine near Bishop, on the line of the C. & C. R. R., is reported looking well.

The Gold Creek M. Co., which gave such promise, is reported to be in a bad way. Suit has been brought against the company by various employes whose wages have remained unpaid for four months.

In Eagle Valley mining district there are 150 men, forty working for wages.

A. G. Campbell at his Italian and Red Eagle mines has a vein 10 feet wide, with a value of $25.

Supt. Kislingbury is exerting the Inter Ocean and has taken the offer of $40,000 for a group under consideration.

In New York City last week a sale of $1500 of the Comstock Tunnel Company's bond was made at 4 per cent, 1 per cent less than the last previous sale in September.

The Boston – Nevada Copper Company's smelter in Mason valley has closed down for thirty days. About 100 tons of black copper and copper matte, the product of the recent run of the smelter, is being hauled to Wabuska for shipment to the refining works.

The owners of the Altoona received from the shipment of seventeen tons of ore 25 ounces of silver, $38 in gold and 5 per cent lead. The chute from which this and other shipments have been regularly made for the past three years has been followed to the depth of 80 feet, and is still looking well at the bottom of the winze. In the neighborhood of $350,000 have been extracted from the mines in the immediate vicinity of this property, all the ores of which run from $50 to $100, and as high as $300 in gold.

Manager Cohen says that during the month of November there was handled at the De Lamar mill nearly 9000 tons of ore. Some say the earnings will not fall short of $300,000 per month; the more conservative fix their guesses at $200,000.

Virginia *Enterprise*: The test of 1000 tons of Gould & Curry rock from old fills in the mine has proved a success. It is probable that 2000 tons of the rock will be reduced, which means work for miners and millmen.

Lyon County *Times*: Work is progressing on the Silver City mine, extending the tunnel. In the past week several promising stringers were cut. This is one of the richest mines in the camp.

Several carloads of black copper and matte were shipped to the reduction works from the Boston-Nevada Copper Company's smelter. The value of the product is said to be about $9000.

Pioche *Record*: Very few claims will be forfeited in this district this year for want of assessment work. Many claim owners, nonresidents, are writing from outside points and arranging for the protection of their interests.

A contract was let on the Reed group for running a tunnel on the north slope of Lookout mountain.

White Pine *News*: A nugget worth $251 was found last week on J. C. Marriott's claim near Osceola. It was oval in shape, measured 4 inches in length, 1¼ inches in width and ⅜ of an inch thick. On this same ground a $76 nugget was found by E. Marriott and another worth $20 by B. Tilford.

OREGON.

A. H. Carson of Grants Pass says that at the present time there is not a placer mine in southern Oregon that has water that is not paying.

At the Jewett mine, Grant's Pass, the 5-stamp mill is running steadily on $20 ore.

The Southern Oregon Miners' Association elected W. H. Hampton Pres., L. L. Jewell Treas. and E. C. Wade Secy.

In the spring of 1896 there were few giants operated in Josephine county, and at the present time there are twelve in readiness for the coming season. Quartz mines are also being developed.

Miner: J. Burkhardt of Pleasant Creek has been prospecting for coal in Jackson county. He has specimens of bituminous coal, the ledge of which he says is three feet wide and as good coal as is produced in the Eastern States, and that it bears every indication that it will prove to be a regular blanket ledge of enormous extent.

WASHINGTON.

Work is progressing on the Acme mine, near Kettle Falls, under the supervision of E. B. Burdick. Considerable ore is ready for shipping.

In the Blind Discovery, once known as the Bunchgrass, a rich body of ore has been struck.

BRITISH COLUMBIA.

(Special Correspondence).—The Tin Horn mill, it is thought, will be run a week beyond the thirty-day limit, as the bins were filled when crushing commenced with the poorest ore obtainable from the lowest of the four tunnels. This ore was run through for fifteen days, according to the advice of the superintendent. Then the better class of ore was taken, and the amalgam showed up beautifully on the plates. The Winchester, said to have the best showing in the camp for the amount of work done, is selling the rest of its treasury stock, with the idea of putting up a large mill to work its two big properties—the Stemwinder and Winchester. The Tin Horn mill (bought in San Francisco) has been pronounced the best in the Province, and it is altogether likely that the dozen projected mills for this camp will come from San Francisco.

Dabney, Parker, Kennedy Bros. & Purgold have purchased the Tamarack group, near Ymir; consideration, $60,000.

The British-American (Ltd.) has purchased seventeen claims in the Algonquin group, near Christina lake; price, $50,000.

R. J. McKenzie bonded the Enterprise, Anchor and Lake View properties in Long Lake from A. Cameron and D. R. Campbell for $50,000.

An English syndicate has bonded the Athleton claim in Wellington from Mack Bros. for $15,000, paying 10 per cent cash.

The Idaho Co., operating the Idaho, in the Slocan, has paid a dividend of $30,000, making a total of $240,000 to date.

A new enterprise is reported on Sheep creek, a mile below the O. K. mine, Trail District. A cyanide plant is being erected by an Englishman, the capacity of which will be fifty tons. It is claimed that ores can be treated at a cost of $3.50 per ton, and that ore worth as much as $6 per ton will pay to mine.

(Special Correspondence).—Reports to-day from Phillips Arm, Vancouver district, state that the London syndicate who are to purchase the copper-gold Blue Bell prospects under certain conditions have made their first payment. They are to spend $10,000 more in developing. If all is well at the end of that time, they will pay in purchase money to the present owners $12,000 more and a block of stock in the new company.

Vancouver, Dec. 4, '97. A. E. GOODMAN.

W. M. Ridpath, president Poorman Mining Company, has smelter returns from the first two cars of ore made by the new management. Thirty-six tons was sent to the Trail smelter and netted the company $707.66, or $19.58 per ton.

All Le Roi ore will be shipped to Northport after Feb. 1st, '98.

THE KLONDIKE.

A Juneau dispatch via Victoria, Dec. 8th, reports that 3000 men were to have left Dawson by the up-river and the overland routes about Nov. 1st, starting in squads of 100, being forced to leave by the scarcity of provisions on the Klondike; 3000 is considered a large estimate.

UTAH.

The management of the mill at De Lamar's Mercur mine has contracted for 2000 of the 2400 H. P. to be delivered at the plant, transmitted thirty-five miles.

Officers of the Anchor Mining Co. the ensuing year are F. Smith, Muskegon, Pres.; E. F. Holmes, Osceola, Mich., V.-Pres.; W. S. McCornick, Salt Lake City, V.-Pres.; H. Myers, Cleveland, Sec.; D. Keith, Gen. Mgr.

The Salt Lake *Tribune* reports the purchase by the Utah Con. M. Co. of a fractional interest in the Salvator lode.

Miner: Supt. Kirby of the Bullion-Beck, Tintic district, has added 60 men, making a total of 100.

Supt. Marx of the Black Dragon, Silver City, is sinking two new shafts.

The Eureka Hill is placing 20 additional concentrators, employing 200 men and shipping 100 bars bullion and 40 cars concentrates each month. Supt. Buckbee is in charge.

Tribune: The record at the Consolidated K. C. R. & S. Company's sampler in Salt Lake City shows that, during November, Maj. Jackson and his staff handled 3000 pounds of gold cyanides, the value of which varies from $9 to $40 per pound.

Mercury: Supt. Moody of the Tioga group, owned by an Ogden company, reports the incline 100 feet and good ore. When the incline was commenced, assays of $1.60 in gold and several ounces silver were obtained. Now the silver values have disappeared, while the gold contents have increased to over $7 in the face.

De Lamar's Mercur mines have contracted for 2000 H. P.; the energy will be transmitted thirty-five miles.

IDAHO.

The Flynn group in the Cœur d'Alenes, comprising sixteen claims, has been bonded to the representative of the Kansas City Smelting Co. for $235,000, 5 per cent of the amount down.

The shaft at the Surprise mine, near Idaho City, is down 150 feet and a station is being cut.

A. J. Mallory, representing New York parties, has bonded 1000 acres of placer land in Boise basin, at Idaho City. He has secured water rights, embracing all available water in that vicinity. The deal includes the property of K. P. Plowman, J. Branstetter and the Hanson property.

The Stemwinder and machinery and the Granite mine, mill and tramway were sold at sheriff's sale at Murray last week, F. Z. Holman bidding in the former at $107,499.73 and J. P. Keane the latter for only $3720.88.

J. Keane, the purchaser of the Granite, has commenced work. The Granite was a famous property in the Cœur d'Alenes in early days, there having been some $600,000 taken from it.

Wardner *News*: A. O. Newton, manager of the Butte and Yellowstone Coal and Coke Co., reports work for the erection of the company's fifteen coke ovens proceeding favorably.

The sale of the Lambert-Post mine, Mount Baker district, is consummated, passing to a Portland, Or., firm represented by H. Stanislawsky. The consideration is said to be $100,000.

Sixty pounds of gold was taken out of the Buffalo Hill placer mines at Elk City, Idaho county, this season.

MONTANA.

The Supreme Court has affirmed decision of District Court of Silver Bow county denying injunction to the Montana Ore Purchasing Co., restraining the Boston & Montana from working the Johnstown and Rarus lodes in Butte. Some time ago Mr. Heinze applied to Judge Lindsay for a temporary restraining order to keep the Boston & Montana from extracting ores from fractions of the Johnstown and Rarus. This was denied, and Heinze appealed to Supreme Court.

It is reported in Butte that J. Cudahy of Chicago has completed a deal for a controlling interest in the Big Seven mine near Niehart for $225,000. The Big Seven is capitalized for $3,000,000, and was originally a silver mine.

The Scotch directors of the Diamond Hill mines near Hassel, says the Helena *Independent*, have decided to make some further investigations as to the value of their property before abandoning work at the plant. A small force of men has been put to work, and a few of the stamps in the Mammoth mill have been started again, the object being to make a thorough test of the capacity of the enterprise and the true value of the ore. The cause of the disappointment of the company in the past is said to have been poor estimates of the value of the low-grade ore in the property. The assays made showed much more gold than was subsequently saved in the practical working of the mine. A. Urquhart, the secretary of the company, now has charge, and H. C. Hansen, formerly assayer for the company, has charge of the chemical and metallurgical departments.

Preliminary work on the Queen in Meagher county, which is to be reopened, has been pumped to the 300-level.

At the Kennett a double compartment shaft 350 feet has been sunk, and the drifting and crosscutting done at that depth has uncovered ore. In the Lucky Boy, by the same company, a shaft 100 feet in depth has tapped the ore body. A 60-stamp mill is in course of erection.

The Butte *Miner* reports that the Empire, in Lewis and Clarke county, has been sold to a Cincinnati syndicate for $65,000.

At the West Colusa and Leonard shafts, Boston and Montana Co., preparations are being made for an air compressor, whose capacity will be 4500 cubic feet per minute, sufficient to keep in operation 65 drilling machines. The motive power for working this will be furnished by seven boilers of locomotive type, having a capacity of 100 horse power each.

A Butte dispatch of the 10th says that in the Low Land mining district a strike has been made in the Ruby mine, from which the owners are taking out "over $2000 a day." The property was purchased last summer from A. Moudenhauer of San Francisco for $90,000, the principal owner being M. E. Graves of New York.

SOUTH DAKOTA.

Black Hills Review: The owners of the Victor mine have let a contract to sink 100 feet and crosscut. This property is fourteen miles from Rapid City. Work will also be resumed on the Storm Mountain property the first of January.

The Hercules M. Co. has engaged F. Rossiter as superintendent of the company's operations in the Black Hills.

The shaft on the Sunnyside is 200 feet; the vein, free-milling ore, is strong and well developed at the bottom. The property is in Pennington county.

The Guilt Edge group, located near Big Strawberry gulch and owned by M. L. Day, is making regular shipments, averaging five tons a day, that return $132 in gold and 3 ounces in silver per ton.

WYOMING.

Business men of Douglas will develop the copper discoveries at the Hazen mine. Sufficient funds have been subscribed for driving a 200-foot tunnel on the lead.

MICHIGAN.

The Tamarack Mining Co.'s dividend of $3 per share, payable December 31st, makes $6 per share, or $360,000 this year. Total dividends now aggregate $5,190,000. When its new No. 5 shaft reaches the lode results are expected which will fully compensate for all the expense and arduous labor connected with the undertaking. It is going down some 5000 feet to pierce the lode cut into by the Camulet & Hecla at their Red Jacket shaft.

The Quincy Mining Co. has determined to build a new up-to-date smelter on the Pewabic sands at Lake Superior, where the Quincy output will be treated. The work of constructing the plant is to begin in the spring, and the estimated cost will be $100,000.

COLORADO.

At Leadville to date there has been no official announcement made of what is being done relative to the drainage of down-town territory. The members of the Pumping Association claim to be entirely ignorant of any arrangements that would tend to show the early inauguration of this work. At the same time there is the general impression that there is a deal on foot whereby a number of interests in the down-town territory will be consolidated, and after this is effected that the combination will be prepared to commence pumping operations.

The air compressor plant owned and operated by the Yak Mining, Milling and Tunneling Company, which was destroyed by fire some weeks ago, is being rapidly rebuilt, and within ten days the new plant will be completed and the company will be in a position to resume shipments of forty to fifty tons per day.

The following is given as the schedule of smelting rates on Clear creek and Gilpin county ores, as agreed upon at the recent meeting of the smelters:

For dry and copper ores the following are the rates fixed:

Gold is paid for at the rate of $19.50 per ounce when the ore contains .05 of an ounce or more in gold.

For silver, 95% of the New York quotation is paid.

Copper, dry, is paid for at $1 per unit.

Treatment charges, Denver delivery, $7.50 per ton; no extra charge is made for silica when the ore contains no more than 40%, the excess above 40% being charged for at the rate of 10 cents for each per cent, and an al-

lowance of 5 cents for each per cent below 40% being made up to a maximum treatment charge of $9.50 per ton for ores not exceeding $25 per ton gross value and $11 for ores exceeding $25 gross value; ores containing zinc, not to exceed 5%, no extra charge, and 50 cents extra charge for each per cent of zinc above 5%.

Lead ores are paid for as follows: Gold, when ore contains .05 of an ounce or more, $19.50 per ounce; silver, 95% or the New York quotations; lead on the basis of $4 per 100 pounds; no charge for zinc up to 10%, and 50 cents for each per cent in excess of 10%. Lead contained in the ores is settled for as follows: For 5 to 10%, 40 cents per unit and $11 treatment charge; 10 to 15%, 40 cents per unit and $9.50 treatment charge; 15 to 20%, 40 cents per unit and $7.50 for treatment; 20 to 25%, 40 cents per unit and $5.50 for treatment; 25 to 30%, 45 cents per unit and $9 for treatment; 30 to 35%, 45 cents per unit and $3.50 for treatment; 35 to 40%, 45 cents per unit and $2 for treatment; 40 to 45%, 47 cents per unit and $1 for treatment; over 50%, 55 cents per unit and $1 for treatment. All treatment charges Denver delivery.

Tailings and concentrates: Gold, when ores contain .05 of an ounce or more, $19 per ounce; silver, 95% of the New York quotation; lead in concentrates and tailings upon a $4 basis, 40 cents per unit if ore contains 5% or more; 10% of silica allowed without extra charge, 10 cents charged for each per cent over 10; 5% of zinc allowed without extra charge, 30 cents charged for each per cent in excess of 5; treatment charge, $3.50 per ton in carload lots, Denver delivery.

Herrington shipments, Cripple Creek, for November aggregated 358 tons, netting $8007.07.

Moon Anchor earnings for November netted $35,000; dividend disbursements for the same month were $15,000.

W. Head will have charge of the Howbert at Cripple Creek.

The northern boundary of the Cripple Creek gold district has been extended three miles by the discovery on Copper mountain of a blanket vein of ore, which ore lies near the surface and is mined with a plow and wheelbarrow.

Beginning with Dec. 1st all transactions on Denver 'change are in the name of the Denver Mining Stock Exchange and Board of Brokers, who succeed the old Colorado Mining Stock Exchange, the latter having gone out of business.

Denver *Record*: The Vindicator, near Cripple Creek, is producing thirty tons a day, encountering no water. The shaft is 485 feet. The ore runs better than ten ounces gold.

The Cripple Creek and G. H. tunnel has let a contract of 400 feet. It will cut at 700 feet the Anchoria-Leland and drain the Moon-Anchor and Midget 800 feet deeper than existing workings in those properties.

The Rigl on Battle is down over 285 feet. Two ore chutes have been opened. The existing reserves will justify production for three months.

The Mabel, Gilpin county, operated by C. F. Barker, is showing well. At a depth of 110 feet below the adit, levels are being driven each way from the winze and in both levels ore is showing of an average value of $50 per ton.

At the Brack Hollow, on Maryland mountain, shipments of mill ore are made which give returns of over two ounces gold per ton.

Ore has at last been found in the Mollie Gibson thirteenth level, but has not been developed sufficiently to ascertain its extent. The strike is said to run about fifty ounces silver per ton and a small percentage of lead. The find is the first of importance made in the camp below 900 feet from the level of the city.

Ouray *Herald*: Work has begun on the tunnel of the Treasury Tunnel, M. & R. Co. in the Red Mountain district. The T. T. M. & R. Co., is a Pennsylvania corporation, organized under the laws of Colorado, capitalized for $500,000. W. J. Hammond, Jr., of Pittsburg is general manager, and R. Whinnerah superintendent. The tunnel will be 7920 feet long, 8 feet high and 8 feet wide, and, at an elevation of 10,500 feet, will run under Commodore peaks to the head of Silveride basin. The bore will cut through the crest of the range 2600 feet from the surface, and deep mining will be one of the principal objects. Two years and a half will be required to finish the work laid out.

NEW MEXICO.

The Othello and Desdemona are shipping two cars per day to the El Paso smelters. J. Mitchell is superintendent.

Discoveries of opals in the Cochiti district are attracting attention. The stones are found in a country extending from the north bank of Colla canyon across to Peralta canyon and south from Colla to Bear canyon, eight miles long and two miles wide. The matrix in which the stones are found is a hydrated quartz.

The H. M. Porter mill, Hillsboro, is running on ores from the Snake, Opportunity and Bobtail mines. At the Opportunity a body of honey-combed quartz, the spaces being filled with a fibrous blood-red substance, has been encountered, which runs sixteen ounces in gold to the ton.

Capitalists have made a deal with H. Whitehill and H. Woods for the purchase of the Helena gold mine. The negotiation provides for the erection of a cyanide reduction works.

The Texas mine, Grant county, is reported to have struck a rich chute of ore in the shaft at 333 feet.

ARIZONA.

Clark and Hoyt of Los Angeles have bonded a group of claims in the Pearce district, Cochise county; consideration, $30,000.

The Kasser G. M. Co., at Globe, in addition to the bullion product in November, shipped two cars of concentrates, running $50 to $60 in gold, to Deming, N. M. J. Kasser is superintendent.

A strike was made in the Rescue, in Gila county. The ore body shows a face of 20 inches.

The Golden Rule, near Tombstone, now operated by the Golden Queen Mining Co., F. Playter superintendent, is working twenty men and shipping ore.

The United Verde is shipping 3,000,000 pounds of copper bullion every month.

MEXICO.

At Santa Elena, Sonora, a 100-ton cyanide plant will start up Jan. 1st. Twenty-five of the sixty stamps in the mill are working on pan amalgamation, with satisfactory results.

The Sonora Railway has contracted with the Boleo Company of Santa Rosalia, Lower California, to move 18,000 tons of copper matte and bullion per annum. The first train load was to be delivered at Guaymas on December 3rd. The freight will go to New Orleans, passing through the United States in bond, thence by steamer to Europe.

NICARAGUA.

In a report to the State Department about gold in Nicaragua, Consul O'Hara at San Juan del Norte says: "Much of the newspaper talk about gold in this country is pure imagination, and while I have faith enough in the gold fields of eastern Nicaragua to believe that gold hunters who have both the time and money to prospect a year or so might find poorer gold mines elsewhere, yet I feel that it is my duty to warn Americans not to come here in the expectation of getting rich in a few years. Up to the present time, with but few exceptions, no one has succeeded in making a fortune in the mining districts of Nicaragua."

CANADA.

The shipments of asbestos and chromite by the Quebec Central Railway from Jan. 1st to Nov. 1st, '97, are as follows:

CHROMITE.	*Pounds.*
From Coleraine	42,560
From Black Lake	3,323,040
Total	3,365,600
ASBESTOS.	*Pounds.*
From Black Lake	998,550
From Thetford mines	13,341,000
Total	14,339,550

AUSTRALIA.

Under date of Nov. 20th, British Broken Hill Proprietary reports: Mill returns for fortnight ending Nov. 17th: 4069 tons of crude ore produced 824 tons of concentrates, which contain 491 tons of lead and 20,122 ozs. of silver.

SOUTH AFRICA.

At a meeting of the Con. Gold Fields, S. A., Co. in London on the 15th ult., John Hayes Hammond said: "I have been a consistent technical advocate of deep-level mining. * * * This section shows you the surface of the ground sloping to the south. The red line represents the reef—that is, the ore-bearing formation, dipping at an angle beginning where it outcrops on the surface at 50°, and gradually flattening to a depth of 30°, where we find it in our deep-level shafts. This map—it is only approximate, I may tell you, but it is sufficiently accurate for the purpose of illustration—will show certain important facts. One is that there is an undoubted tendency of the reefs to flatten in depth. It will show you, therefore, that we shall not have to go as far to reach the reef in our deep-level properties as might have been estimated from a study of the superficial developments of the reef. It will show you in connection with this particular property another most important fact—that is, there is not the slightest tendency for the diminution in size of the reefs or decrease in the value of their gold contents. Now, I have talked to you tentatively for the last few years about mining to a depth of 3000 feet. Having gradually educated you up to that point, I may tell you that we fully expect to be able to mine depths of over 5000 feet, to which depth, indeed, mining is carried on profitably in other countries. We have actually demonstrated by extensive developments the value of this ground to a depth of 2385 feet, and there is no question of the continuance of the reef and the ore bodies to a depth of over 3000 feet, because that has been demonstrated by the Bezuidenville bore hole, as I explained at last year's meeting. The technical difference between mining on a deep-level property and mining on an outcrop property consists in this, that in the mining of an outcrop property the reef is followed by an inclined shaft starting immediately upon the reef and, consequently, immediately upon the ore bodies from the outcrop. In the case of a deep-level property the reef lies considerably below the surface of the ground, and must be reached, therefore, by vertical shafts sunk through barren ground at various depths from 1500 to 2000 or 3000 feet. The only engineering difference is that you must sink a vertical shaft to reach the reef. When the reef is once struck the character of mining is precisely the same—the same incline shafts and precisely the same machinery are used, and the cost is not one penny per ton more.

* * * * * *

I now call your attention to the other map we have prepared of the central section of the Rand. This section of the Rand is the cream of the district. It is not only that, but it is a mining district unequaled in value in the history of gold mining operations throughout the world. It extends for about eleven miles from the Langlaagte estate to the Witwatersrand (Knight's). You will see this company's important holding colored on the map. The value of this district has been conclusively established by upwards of 100 miles of developments actually on the reef by numerous shafts intersecting the reef at different points in the area and by still deeper boreholes. It has been conclusively proved also by the fact that over 10,000,000 tons of ore have been mined within the area. Last year twenty-two companies were operating within the area, and actually distributed in dividends about £1,500,000 from working something like 2,500,000 tons of ore, and this year during thepast seven months twenty-five companies have been in operation—you will see the deep-level mines are gradually coming in—and they have extracted about 2,000,000 tons of ore, and have actually paid a profit of £2,000,000, or nearly £1 per ton. I think it is simply wasting your time to endeavor to strengthen your belief in this section, as this section is universally acknowledged as an extremely rich and reliable one. But it is also estimated that from within this section something like £4,000,000 sterling will be extracted down to a depth to which mining is acknowledged by everyone to be feasible. To realize this sum I will tell you it almost equals the output of the entire United States of America during the last fifty years, and it exceeds two-thirds of the entire output of the world for the same period."

Commercial Paragraphs.

THE Alaska Transportation Company of San Francisco and New York is building three steamers at the Fulton Iron Works, San Francisco.

THE six Leffel 1000 H. P. water wheels to be installed on the Big Hole river in Montana will transmit the power twenty-five miles and operate under a 60-foot head. Leffel & Co. are building a plant for Georgia of two wheels for 1600 H. P., 112-foot head, fourteen miles transmission.

THE E. P. Allis Company, Milwaukee, Wis., is building an addition to its machine shop at the main works—a one-story brick building, 106x150 feet, with a double roof, to be used for finishing their heavy engine work. A 30-ton Shaw electric traveling crane will run through the center the entire length of the building, with 30 feet clearance from the floor to the lower line of the crane.

THE Gutta Percha and Rubber M'f'g. Co. reports an increasing demand for the "Spadone" concentrator belt, over 100 having been placed during the past year. The thickening and strengthening of the outward rolling edge of the "Spadone" belt, adding from three to five years to its working life, is a noticeable improvement, and the results show that it is appreciated by practical mill men.

THE Kansas City Smelting & Refining Company has adopted a flag which will float over all works and agencies of the company in the United States and Mexico. The colors of the flag are a combination of the national colors of both countries—red, white and blue, and red, white and green. On the red is a crescent, on the blue a Maltese cross, on the green a circle, and on the white a letter. These signs are their chemist's symbols for the four metals—gold, lead, silver and copper. The products of the smelter bear the name of "Alchemist's Brand."

THE Colorado Iron Works Co. has just closed a contract with the Germania Lead Works, Salt Lake City, for five Bruckner roasters, complete. They have entered an order for a slag equipment complete, including four 44 cubic feet capacity self-dumping slag trucks and electric generator, electric locomotive, standards, etc., for handling trucks, and also report the shipment of four 44 cubic feet capacity, self-dumping slag trucks to the Copper Queen Mining Co., Bisbee, Arizona, and one self-dumping slag truck, of 60 cubic feet capacity, to W. A. Clark, Butte, Mont.

NEW gold dredges now building handle 2000 cubic yards of gravel per day, at a cost varying according to locality and price of fuel of from 3 to 7 cents per yard, the low cost of 3 cents per yard being attained by the dredge built by the Risdon Iron & Locomotive Works of San Francisco, now in operation upon the Yuba river, Cal. This dredge has given such satisfaction that Captain Couch, formerly of the Boston & Montana Co., and who now is interested in a gold dredging proposition in California, has recently placed an order with the Risdon Iron & Locomotive Works for four complete dredges.

THE Gates Iron Works are building an addition to their establishment at 650 Elston avenue, Chicago. The addition will be 80x365 feet, built of steel and brick. The steel work will be installed by the Pittsburg Bridge Company, who have the contract to complete their work in sixty days. The whole shop will be covered by an electric crane built by the Morgan Engineering Works, the crane having an 80-foot span, with 30-ton lifting capacity. This shop will be the main machine shop and power house of the plant. The present shops will be used more particularly for erecting and shipping. The new shop will open into the old one, making one large floor space.

A NOTABLE change is about to be made at Omaha, Neb., where the new Omaha Thomson Houston Electric Light Co. is undertaking the concentration of its station. It has recently placed an order with the General Electric Company for three monocyclic alternators, each one to be directly connected to a compound condensing McIntosh and Seymour engine. These alternators will be revolving armature, 48-pole machines, each of 300 kilowatts at 150 revolutions, and will be separately executed. They will take the place of a considerable number of smaller machines and will be used to furnish current to an extensive system of 3-wire secondary main fed from large transformers.

Recently Declared Mining Dividends.

Alice M. Co., Utah, $20,000; Dec. 20th.

Pennsylvania, Grass Valley, Cal., 5 cents per share; payable immediately.

Iowa G. M. & M. Co., Silverton, Colo., ½%, $5000.

Calumet and Hecla, Montana, dividend $10 per share; payable Jan. 1. With that dividend—the 105th declared by the company—the total dividend disbursements aggregate $51,850,000.

Morning Star M. Co., Placer county, Cal., $6 per share; payable immediately.

Geyser-Marion M. Co., Utah, $9,000: Dec. 10th.

Silver King M. Co., Utah, 25 cents per share, $37,500; Dec. 10th; total amount dividends to date, $1,312,500.

Recent California Mining Incorporations.

Nancy Hanks Con. Co., San Francisco; capital stock $500,000, subscribed $400,000.

Aromas M. C., Watsonville; capital stock $500,000, subscribed $150,000.

Chapman Smelting Works Co., San Francisco; capital stock $100,000, all subscribed; C. Solomon, G. H. Brooker, I. Muraski.

Granada Co., Los Angeles; capital stock $100,000, subscribed $500.

Try Again M. Co., S. F.; capital stock, $50,000; $25 subscribed; S. Elder, D. S. O'Brien, J. M. Hooper, W. H. Chapman, C. H. Miller.

American G. M. Co., S. F.; capital stock, $500,000; $125 subscribed; W. C. Mysell, Flora D. Mysell, W. F. Jones, J. C. Mysell, S. Dobzensky.

The Nancy Hanks C. M. Co., Nevada Co., Cal.; P. K. Dow, A. McMahon, J. H. Isham, F. Lapham, A. S. Groth.

Lady Alice G. M. Co.; T. L. Ford, F. P. Kelly, W. M. Abbott, H. Newberg, C. W. Cross.

Standard Placer M. Co., Eureka; capital stock, $60,000; subscribed, $40,500; N. H. Price, A. T. Crane, C. Potter.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING NOVEMBER 30, 1897.

594,514.—PRESSURE GAGE—C. W. Bemish, Tacoma, Wash.

594,776.—BAND CUTTER—D. R. Burnham, Pullman, Wash.

594,600.—SUBMARINE BUOY—E. A. Chamberlain, Woods, Or.

594,462.—THRUST BEARING—O. F. Cook, San Jose, Cal.

594,728.—LEMON SQUEEZER—Cox & Hughes, Red Bluff, Cal.

594,583.—BUNDLE CARRIER—A. W. Duck, Oakland, Cal.

594,615.—BIT—B. H. Fowle, Spokane, Wash.

594,637.—BICYCLE SUPPORT—W. F. Hewlett, Pomona, Cal.

594,695.—WATER FILTER—W. Hunter, S. F.

594,628.—ADVERTISING DEVICE—A. J. Kellogg, Portland, Or.

594,803.—MARINER'S COMPASS—O. Kustel, S. F.

594,629.—SYRUP PITCHER—E. G. Lantz, Albany, Or.

594,801.—MUSICAL LADDER—Ella L. B. Mack, Los Angeles, Cal.

594,422.—PULVERIZER—A. Paul, S. F.

594,757.—RAILWAY SPIKE—J. Richard, Bisbee, A. T.

594,654.—CLOCK—J. Schulte, Jr., Monterey, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CLOCKS.—Joseph Schulte, Jr., Monterey, Cal., assignor of one-half to Thomas J. Field, same place. No 594,654. Dated, Nov. 30, 1897. This invention relates to improvements in clocks and timepieces. The object of the invention is to regulate the clock by a compensating device which increases the rapidity of the pendulum or balance wheel beats in proportion as the strength of the spring giving the impulse decreases. It also enables the pendulum to automatically regulate and center itself with relation to the escapement wheel so that its beats will be of even duration, although the clock itself may incline a little to one side or the other. It consists essentially of a cam within the train of clock mechanism having a gradual increase in curvature from the initial point to the terminus of the cam surface, a fulcrumed lever having the free end continuously in engagement with the cam so that the impulse of the escapement is increased in proportion as the tension of the winding spring is reduced. A disk is centrally mounted with relation to the escapement wheel, a pallet and verge is carried by a downardly projecting extension of the disk, the verge connects with the pendulum rod so that the tilting of the clock allows the disk and extension to move and adapt itself automatically with relation to the position of the pendulum.

MARINER'S COMPASS.—Oscar Kustel, San Francisco, Cal. No. 594,803. Dated, Nov. 30, 1897. This invention relates to improvements in mariner's compass. It consists in the novel construction of the compass card, means for supporting the magnetic needles employed therewith so that the whole device is as light as possible consistent with permanency. It consists essentially of a compass card composed of a continuous circular sheet of woven material with a pivotal center and a peripheral supporting, the surface of the card having the points of the compass marked thereon and a support for the magnetic needles consisting of a band to which the needles are fixed extending from side to side of the rim and crossing below the center of the compass.

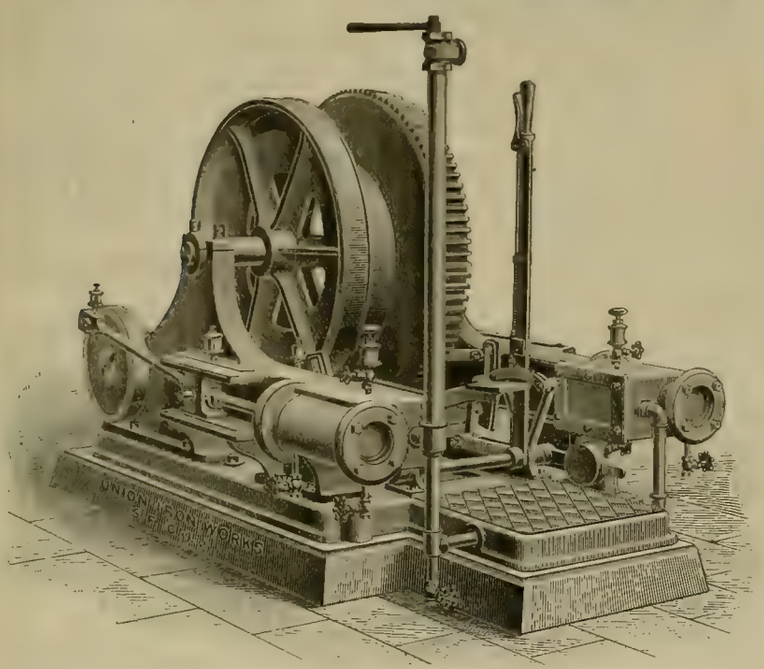
WATER FILTER.—William Hunter, San Francisco, Cal., assignor to John B. McGlew of same place. No. 594,695. Dated Nov. 30, 1897. This invention relates to water filters. It consists essentially in the combination with an exterior case of an interior removable chamber containing any suitable filtering substance, an inlet pipe with pressure regulating valve opening into the lower part of a main chamber beneath the filtering chamber, so that the filtering takes place by an upward pressure, a settling chamber and blow-off cock and a discharge pipe connecting with the upper clear water chamber above the filter, so constructed that the action of discharge serves to aerate the water at the instant when it is drawn off from the filter.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST



HOIST FOR PROSPECTING.

For Prospecting Purposes or Underground Work,

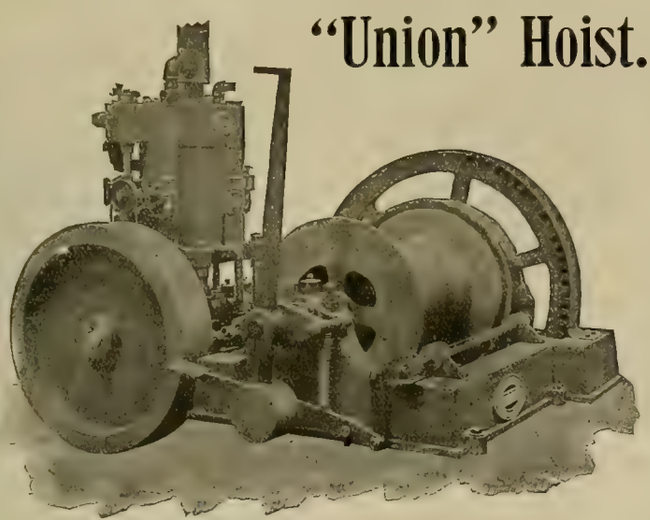
USING COMPRESSED AIR.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

"Union" Hoist.



The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton 125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over 600 feet of ⅝-inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.

—BUILD THE—

"Union" Gas Engines,

Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

SAN FRANCISCO LAUNCH CO., - Foot of Stockton Street, - SAN FRANCISCO, CAL.

Coast Industrial Notes.

—An electric light plant is in course of construction at Keswick, Shasta Co., Cal.

—On the 1st inst. there were in California 115,992 barrels flour, 9,132,640 centals wheat, 3,136,020 centals barley, and 713,749 sacks beans.

—The Santa Fe Pacific Company is now consuming 850 barrels oil daily. The S. P. Ry. Co. is credited with a daily consumption of 350 barrels.

—A contract for a new steel ferryboat for the Southern Pacific east side and San Francisco bay service was closed this week with the Union Iron Works.

—There were only two disengaged wheat ships in San Francisco harbor this week. The tonnage on the way is 35,000 tons less than it was at this time last year.

—For some time there has been a movement on foot for a combination among the Columbia river salmon canneries, and there now seems no doubt of its consummation next season.

—Last Monday Representative Barham introduced in the House the bill introduced in the Senate in the last Congress by Senator Perkins providing for Nicaragua canal construction.

—The municipal authorities of the City of Mexico want bids for 30,000 feet of 42-inch and 40,000 feet of 30-inch straight steel riveted pipe, to be used in the City of Mexico water works.

—The Western Union Company at a cost of $250,000 has put in a new 2000-mile copper wire between San Francisco and Chicago. The company is also stringing a wire between San Francisco and Seattle.

—Santa Clara county, Cal., has produced this year 50,000,000 pounds prunes, as against 37,000,000 pounds last year. The total annual consumption of prunes in the United States at present is 70,000,000 pounds.

—At the Mare Island, Cal., navy yard the working force on the island has been decreased until now scarcely 800 men are employed there. This is not caused by a want of work; it is carrying out instructions received from Washington.

—The Costa Rica Congress has approved the Pacific railway survey to Tirives, on the Gulf of Nicoya, and has given the Department of Works authority to let construction contracts. The Tirives harbor will be improved at a cost of $1,500,000.

—It is estimated that the California lemon crop for the crop year of 1897 was in the neighborhood of 250,000 boxes, whereas the 1896 crop was not more than 150,000 boxes. From all indications California will have fully 500,000 boxes of lemons to market in 1898.

—Twelve thousand acres of the San Lorenzo ranch, Monterey county, Cal., have been purchased by Claus Spreckels from C. H. King for $275,000. About 7000 of the 12,000 acres are adapted to the cultivation of sugar beets, for which use the ranch has been purchased.

—Linemen of the W. U. Tel. Co. are at the Cascade tunnel, on the Northern Pacific railway, where a lead cable will be put under ground, carrying all the wires of the company and doing away with the old system of crossing the divide by means of the switchback.

—The U. S. steamer Alert is being put in readiness at San Francisco for a trip to the Pacific terminus of the Nicaragua canal, where she will be at the disposal of the United States commission now investigating the proposed route of the inter-ocean canal and report on its feasibility and probable cost of construction.

—The California Harbor Commissioners at a special meeting have accepted the ironwork done on the new ferry depot at the foot of Market street, San Francisco, by the Risdon Iron Works. The contract amounted to $183,000, and that amount has been paid, less $45,950, which the Commissioners will hold for thirty-five days, according to agreement.

—The Newhall, Los Angeles Co., Cal., country is now the center of interest among oil men. The oil is declared to be of paraffine base, registering 96° purity. A ready market at $4 per barrel is said to be waiting for the product in San Francisco for refining purposes. The discovery was made upon a grant that had been in litigation for the past seven years.

—The Pacific Cable Company proposes to connect San Francisco with the Hawaiian islands near Honolulu, and from there with Japan and Australia. It is expected that San Francisco and the Hawaiian islands will be connected by cable within two years. It will require 9000 miles of cable to connect San Francisco with the Hawaiian islands, Japan, China and Australasia.

—Steel and concrete in combination are being tried as foundations for pavements in San Francisco. The method of preparing the steel is as follows: A very thin, slight sheet steel is slit perpendicularly in short slits, say three inches long, the slits running in a straight line clear down the sheet, each new slit beginning about half an inch from the point where the preceding slit ended, and the lines of the slits being about half an inch apart. This leaves the sheet of steel cut into long strips of half an inch wide, but connected together every three inches or so. Then the sheet is grasped by the same machine on two opposite sides and pulled apart, or "expanded," so that all the openings appear in diamond shape. The sheet then looks like a light wire grating. It is now ready for use in the street. The earth of the street is then graded into shape and covered with a bed of sand. On this sand is laid the sheet of expanded steel. Over the steel is then laid a layer of concrete. The concrete is tamped into meshes of the metal, forming a perfect bond. This makes a foundation that will never give way. Upon it can be laid asphalt, bituminous rock, basalt blocks, wood blocks, brick or any kind of surface pavements desired, the permanency of the entire pavement depending entirely upon the character of the top work.

—Competent authority estimates that there will be next season nearly 100 sawmills operating in Alaska. Many of these will be portable, but the amount of lumber they will cut will be large. The product will be all for local consumption, and lumbermen in Alaska will not bother their heads over distant markets, the foreign trade, exacting rail rates or the scarcity of cars. They will not bother themselves about stumpage, or the price thereof. They will simply plump their mills down in the forest and saw wood and sell it. There will be mills on the coast, on the interior lakes and rivers, wherever there is mining, boat building, railway construction or the upgrowth of camps or towns. But that primitive kind of lumbering will not last long. If the realization shall be equal to the prospect for gold in Alaska and the neighboring British territory, there will be vast development in those boreal regions within a few years.

—At the meeting of the Santa Fe Pacific directors last week the details of the exchange between the Atchison and the Southern Pacific, whereby the former secures the Mojave division for the Sonora Railroad, were completed. The Mexican Government objected to a sale of the Sonora Railroad to the Southern Pacific outright, as was at first proposed, so the Sonora road has been leased to the Southern Pacific for a long term of years. The Santa Fe has purchased the Silver City & Northern Railroad, running from Whitewater to Hanover, N. M., eighteen miles, which road was owned by the Southwestern Coal and Iron Co. The road in 1897 did not pay cost of operation by $2845, gross earnings being $16,000, but the Atchison will extend the road three or four miles to the Santa Rita Copper and Iron Co. mines, where deposits of iron have recently been discovered. The Santa Fe have agreed to sell the branch of the Southern California Railroad running between San Diego and National City, about twelve miles, to the National City & Otay Railroad, owned by the San Diego Land and Town Co. This branch has not been profitable to the Atchison since the Southern Pacific Railroad shops were removed from the line of this branch to San Bernardino, and of late but one train a day has been operated.

Personal.

J. J. CRAWFORD has returned from Placerville, Cal.

ROSS E. BROWNE is back from a business visit to Idaho.

C. W. RAYMOND is Supt. of the Grand Victory, Placerville, Cal.

M. GRUYARD is Supt. at the Pelletin-Floris, Hillsboro, New Mexico.

F. A. HUNTINGTON is visiting Randsburg, Cal., and has bonded a mine there.

D. P. PIERCE, mining superintendent, is in San Francisco from Placerville, Cal.

M. HOSKINS has been appointed Supt. of the Cripple Creek, Colo., Con. Co.'s Geneva.

MANAGER F. WILSON has assumed control of the April Fool property, De Lamar, Nev.

T. A. HOUGHTON, late of the Grand Victory, is Supt. of the Pocahontas, El Dorado, Cal.

S. T. MURCHIE has been appointed Supt. of the Benton-Emery mine at Nevada City, Cal.

R. H. CAMPBELL, who has been at Ashcroft, B. C., this season, has returned to California.

ED MCCANNA, supt. Anaconda mine, has returned from San Francisco to Butte, Montana.

H. S. SABIN of San Francisco is the newly appointed Supt. of the Saucerman mine, Garden Valley, Cal.

D. W. C. MORGAN of Placerville, Cal., who was stricken with paralysis a year ago, is able to leave his rooms.

JOS. GRUSS, M. E., has returned to San Francisco from an examination of mines in western Australia.

TIREY L. FORD has removed his law offices to the 12th floor of the Spreckels B'ld'g, Third and Market Sts., S. F.

CHAS. STOCKS of Nevada Co., Cal., has returned from the superintendency of a South African mining property.

JOHN DAGGETT has gone to Santa Rosalia, Arizpe district, Sonora, Mexico, to assume the management of his mine there.

F. CORKILL, Supt. of the Holmes Mg. Co. and of the Candelaria W. & M. Co., Candelaria, Nev., is in San Francisco.

HAROLD WILSON and C. M. Henrie of Silverton, Colo., go to Tasmania this week to take charge there of a pyritic smelter.

C. A. PETERSON of San Francisco left last Wednesday for South America to take charge of gravel properties for an English company.

COL. TRUMBO has purchased the interest of Stilson Hutchins, proprietor of the Washington *Post*, in the Old Glory mine, near Tucson, Ariz.

J. B. MONTAGUE and Geo. P. Thurston were recently elected president and secretary, respectively, of the Orleans M. Co. of Grass Valley, Cal.

JEAN F. WEBB of St. Louis is general manager for the Bimetallic Co. of Montana in their new enterprise at the Pocahontas, El Dorado, Cal.

FRED BRADLEY, Supt. Bunker Hill mines at Wardner, Idaho, and the Spanish mine, Nevada Co., Cal., left San Francisco this week for Mexico.

GUS KARTSCHOKE, Pres. of the Champion M. Co., has returned to San Francisco from a business trip to the Champion and St. Gothard mines, Nevada City, Cal.

HON. J. H. NEFF, Pres. State Miners' Association, was in the city last Thursday to attend a meeting in reference to the approaching Golden Jubilee.

P. REARDEN, Gen. Supt. of the Abbott Quicksilver Mining Co., has just struck a ledge in the new Rearden tunnel at a distance of 700 feet, cutting a fine body of quicksilver ore. Mr. Rearden is in San Francisco purchasing machinery for the new tunnel.

H. B. ADSIT, late manager Tomboy, Colo., mine, this week paid $25,000, first payment on the Terrible and Butterfly properties, near Telluride, Colo., which he has bought for $150,000, and will manage for the purchasers, Wichman, Vautin & Roepel of London, Eng.

Recent Publications.

"*Operations of Electric Mining Plants*:" An elaborately produced pamphlet from the Power and Mining Department of the General Electric Co., Schenectady, N. Y., with detailed statistics of practical workings of electric mining locomotives in various parts of the country, from mining superintendents.

"*The Strength of Materials*:" A textbook for manual training schools, by M. Merriman; 12mo., $1. John Wiley & Sons, N. Y. city. A practical presentation of strength of beams, columns and shafts, with rules for investigation and design by simple algebraic and geometric methods. A chapter on resilience and impact, and one on the manufacture and general properties of materials, are also included.

Colorado's Gold Fields, Illustrated.

Just out, with correct map and nearly 100 mining views natural as life. This valuable book will be sent free, prepaid, with our big 56-col. family paper 3 months on trial for 25c; club of 5 and 5 books $1. Latest mining news. Mention THE PRESS and address *Illustrated Weekly Sentinel*, Denver, Colo. Cripple Creek is fully described.

WANTED

POSITION AS SUPERINTENDENT OF GOLD Mining property, quartz or gravel, or would travel as expert for good company. Address, "EXPERT," MINING AND SCIENTIFIC PRESS, San Francisco.

WANTED.

LOW PLACER GROUND IN CALIFORNIA, FOR DREDGING PURPOSES. Must Exceed 50 Cents per Cubic Yard.

Send full description with price and terms to W. H. BARRY,..... Pasadena, Cal.

FOR SALE, AT A BARGAIN.

A complete Champion Prospecting Diamond Drill Outfit. Good as new. Used very little. Does successful work. For price apply to GOLD HILL MINING CO., Angels Camp, Cal.

FOR SALE CHEAP.

First-Class Air Compressor (Steam driven) and Drill, New.

Also, 3-Ton Capacity Pulverizer.

A. L. FISH, 59-61 FIRST ST., San Francisco.

GOLD! Promoter and capital desired to put in operation a new phenomenal gold extraction method which also manufactures gold. Address Box 576, Lincoln, Nebraska.

"THE MINING LAWS OF CALIFORNIA"

by Frederic Hall, author of Hall's Mexican Law. Price, 30 cents by mail, Postal of Express Order. With opinions of the Attorney-General and J. F. Cowdrey, Esq., on the New State Location Law and Court Decisions on important points. Address J. BELL, Publisher, Box 424, Los Angeles, Cal.

RUPTURE, Hydrocele, Varicocele, Piles, Fissure, Fistula, Ulceration, etc., cured without operation or detention from business. NO PAY UNTIL CURED. Consultation Free. Call or send for pamphlet.

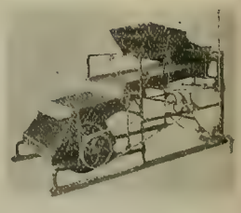
Pacific Placer Machine.



Patented APRIL 20, 1897.

KLONDIKE MACHINE.—If you are going to placer mining in Klondike or any other country, you cannot afford to be without one of these Machines. It will work any class of placer ground, river or sea sands, and save the fine float gold as well as the coarse. The material is graded in four different grades in passing through the Machine. The coarse gold is caught in the riffles above the plates; a double screen is arranged above the plate and amalgamating cylinder, allowing nothing but the water and fine material to pass onto the amalgamating plate and cylinder. This is the Machine for dry countries, as it requires but a small amount of water. By attaching one of our small pumps the Machine will supply its own water from streams or well and raise water 20 feet. One miners' inch of water will supply our large Machine by using the water over. Will work 40 to 50 tons per day. Can be run by hand or power. Built in three sizes. Price $150, $300, $450, f. o. b. S. F. Capacity 10, 25, 40 tons per day. Weight 175lb, 400lb, 550lb. Manufactured for both quartz and placer. Send for Catalog. PACIFIC MINING MACHINERY CO., 127 First St. S. F., Cal.

SAN FRANCISCO ARTIFICIAL LIMB CO.,

MENZO SPRING, Proprietor,

Manufacturer of the BEST

✦ Improved Artificial Limbs, ✦

Office and Works, 9 Geary Street, San Francisco, Cal.
Address, (Junction Kearny and Market.)

Send for Measure Blanks for Self-Measurements; free to any address on application. Commissioned by U. S. to furnish Limbs on Government Orders. Artificial Limbs Repaired with Skill and Dispatch.

British Columbia.

E. S. TOPPING, TRAIL, B. C.,

Has prospects for sale in Trail Creek and the whole of the Columbia basin. Will buy legitimate stock and mines for investors. Will examine mines. Has lots for sale in Trail and Deer Park.

By H. S. Osborn.....$1 50

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....$3 00

Modern Copper Smelting.
By Edward Dyer Peters, Jr. Seventh edition. Rewritten and enlarged. Profusely illustrated....$5 00

Practical Treatise on Hydraulic Mining.
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc Price, postpaid.....$5 00

Practical Hydraulics.
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Explorer's and Assayers' Companion.
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$5 00

The Metallurgy of Gold.
By M. Eissler. Profusely illustrated.....$5 00

Notes on the Treatment of Gold Ores.
By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

Cyanide Processes for Gold and Silver Ores.

GOLD IN COLORADO!
Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

Assaying Gold .....AND..... Silver Ores.

A Standard Work.

By C. H. AARON.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the pratical miner can mistake his meaning.
The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.
Table of Contents:—Perface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price **$1.00** postpaid. Sold by the **Mining and Scientific Press**, 330 Market St., San Francisco.

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & Co.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press.* We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

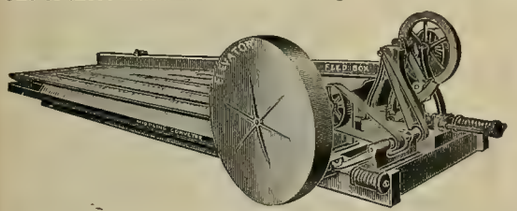
WILFLEY CONCENTRATOR.

PRICE $450 F. O. B. San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.



WILFLEY CONCENTRATOR.

SEND FOR CIRCULARS.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, barring none.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

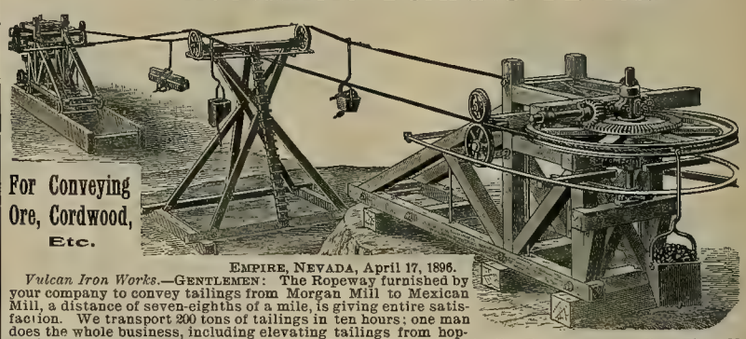
VULCAN ROPEWAY

—WITH—

AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.



For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

Market Reports.

The Markets.

SAN FRANCISCO, Dec. 9, 1897.

General trade is good for the closing month in the year owing to the retail distributers carrying comparatively light stocks, which necessitates filling in or assortment buying. The general tendency of prices is to more ease for the remainder of this month, so as to begin 1898 with small stocks in all lines except those that promise a higher range of prices after the turn of the year. Foundrymen and machinists are quite hopeful. They look forward to a larger volume of business than before enjoyed. There can be no doubt that the present outlook is favorable for the larger works having more work than they can handle expeditiously unless they increase their plants, and the overflow will go to the smaller concerns. The East reports a fair degree of activity with iron workers, with the promise of large increased business next year. In expectation of this there have been liberal transactions in iron at the different producing centers.

The local money market continues on easy lines, with no friction reported in any direction, notwithstanding this is the month when many loans are drawn in for annual settlement purposes in January. The wholesale trade report that collections have been made with general ease. It is stated that the retail trade, taken as a whole, will commence 1898 on a better financial footing than for several years. The higher prices paid for dairy, farm and orchard products in agricultural sections, higher prices for logs and lumbering districts, and a general boom in gold mining have contributed to this condition. The banks in this city and also in the country have more idle money than usually obtains at this season of the year. The East reports general ease, notwithstanding the speculative movement in wheat calls for considerable, as does the carrying of cotton which is coming on the market.

New York Silver Prices.

NEW YORK, Dec. 9. — Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	27¼	59½
Saturday	27 9-16	59⅝
Monday	27¾	60
Tuesday	27¾	60
Wednesday	27⅞	59¼
Thursday	26⅞	58

	Copper.	Lead.	Iron.	Tin.
Fri.	10 75 @10 87½	3 75	10 00@12 25	13 75
Sat.	10 80 @10 87½	3 72½	10 00@12 25	13 75
Mon.	10 80 @10 90	3 72½	10 00@12 25	13 77½
Tue.	10 80 @10 90	3 75	10 00@12 25	13 77½
Wed.	10 80 @10 90	3 75	10 00@12 25	13 77½
Thur.	10 80 @10 90	3 75	10 00@12 25	13 77½

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	6
Commercial Loans, prime	5
Call Loans, gilt edged	4@4½
Call Loans, mixed securities	5@6
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	12½c Prem
New York Telegraphic Transfer	15c Prem
London Bankers' 60 days	$4.83¾
London Merchants	$4.82½
London Sight Bankers	$4.86½
Refined Silver, per oz., 1000 fine	58
Mexican Dollars nominal	46½

SILVER.—The market advanced to 60 cents here and New York and to 27¾d in London. At the higher prices it hung two days, after which it sold down. It is hard to affirm the underlying cause of the demand for silver that put up the market price, unless it was the Chinese New Year's demand. It is well known that the call from this source is quite active up to the end of the time when it is too late for shipments to reach China in time. Sales were made in our market at 60 cents for shipment by the last outgoing steamer, but now the demand is off and will be confined to the usual requirements. The last steamer for China took out $104,600 in bullion.

MEXICAN DOLLARS.—The demand has been exceptionally good for shipment to China in time to reach there for the New Years. The last steamer for Hongkong took out 1,252,319 in dollars. The call is expected to be comparatively light from now on.

COPPER. —The market has ruled fairly steady throughout the week both at home and abroad. The last circular letter received from James Lewis & Son, Liverpool, reports: "High conductivity copper has been in demand for the Continent, resulting in sales of 500 tons. A proposition has been laid before the Government to lay a cable from England to Australia via British possessions, the length being 13,684 nautical miles. The Schuckert Company of Nuremberg announces that they have orders on hand for electric lighting, power and tramways, amounting to sixty-two millions of marks—of which twenty-six millions are for foreigners—and have great difficulty in supplying the demand."

For the first ten months the consumption (in tons) abroad compares as follows:

Country.	1896.	1897.
England	71,823	72,039
France	30,841	34,211
Germany	37,610	46,828
Total	140,274	153,078

TIN.—The market has ruled quiet for both pig and plates. Free sales have been made of both for next season delivery. The markets at the East and abroad are unchanged.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " " light, "	4 00@—

SHOT.—The market is steady.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 40
Drop, B and larger sizes, "	" 1 65
Buck, Balls and Chilled, do, "	" 1 65

POWDER. —The consumption continues to show an increase over the corresponding time in 1896.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¼c, according to strength and quantity; No. 2, from 9 to 11c, according to strength and quantity.

QUICKSILVER.—The market is steady. The last steamer for Mexico took out 190 flasks.

Our market is quoted at $39 for domestic consumption and $35@36 for export to the west coast of Mexico.

LEAD.—The market has held to fairly steady prices. The demand is slow.

Our market is quoted in jobbing lots as follows per 100 pounds:

Pig	4 75	@	5 00
Sheet	6 30	@	6 80
Pipe	5 60	@	6 10

IRON.—There is nothing new to report so far as values are concerned. A press telegram from Chicago, Dec. 8th, reports: "The *Industrial World* says: December gives early promise of a record breaker in iron and steel in the West. The month is usually quiet and dull. This year it surpasses the expectations of the trade. Orders come chiefly from manufacturing sources wanting material for immediate consumption. There are also the beginnings of trade for 1898. Prices are generally steady. Pig iron is firm on the basis of $11 for No. 2 Foundry. Structural material tends somewhat toward easier quotations, though prices are unchanged."

NAILS.—The market is firm at an advance, with only a fair demand ruling.

We quote the following basis: 20d to 60d, inclusive—wire $2.50, cut $2.40.

COAL.—The market is fairly active for all grades, but particularly household. Values are maintained at combination prices.

Receipts of Coal for the week ending Tuesday were as follows in tons: Puget Sound, 11,802; Coos Bay, 1570; Sydney, 2385; Nanaimo, 2300; Swansea, 2076. Total, 20,133 tons.

We quote as follows:

SPOT FROM YARD—PER TON.

Wellington	$8 00@— —
Greta	6 00@ 6 50
Nanaimo	6 50@— —
Gilman	5 50@— —
Seattle	5 50@— —
Coos Bay	—@ 4 75
Cannel	9 50@— —
Egg, hard	12 00@— —
Wallsend	6 75@— —

TO ARRIVE—CARGO LOTS.

Australian	5 75
Liverpool Steam	6 75
Scotch Splint	7 50
Cardiff	7 50
Lehigh Lump	12 00
Cumberland, bulk	10 50
Egg, hard	9 50
West Hartley	6 75

COKE.—Imports the past week aggregate 363 tons from Swansea. The market is steady.

The market is quoted as follows:

Gas Companies'	— —		— —
English, to load	— —	@	— —
" spot, in bulk	11 00	@	— —
" in sacks	12 00	@	— —
Cumberland	10 00	@	— —

PLATINUM.—The market is firm.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

BORAX.—The market is firm, with a free shipping demand to the East.

The market is quoted as follows:

Refined, in carload lots, in barrels	5½
Refined, in carload lots in sacks	5¼
Powdered, in car lots	5½
Concentrated, "	5

ZINC.—The market is firm.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

ANTIMONY.—The market is steady.

Our market is quoted at 8¼c in a jobbing way. New York mail advices quote 8c for Cookson's, 7½c for Hallett's and 7c for Japanese.

Chemicals.

The market continues quiet. Stocks in general are not large and consequently a better demand is looked for soon by first hands, which may strengthen values. New York advices report a slow market with more or less weakness, which is usual to the close of the year.

SULPHURIC ACID.—The demand is quiet.

We quote in a jobbing way at 1¾c per lb for 66%.

ACETIC ACID.—The market is steady at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported firm from store at 6½@7c per pound in carboys.

BONEASH.—There is a fair demand at quotations.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3¼c; No. 2, 2½c.

BLUE VITRIOL.—Our market is steady, with better inquiry.

We quote in a jobbing way at 4c per pound.

SPELTER.—The market is steady.

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is easy.

Our market is quoted in a jobbing way at $1.40 a pound.

SODA ASH, 58% (LeBlanc process).—The market is steady at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is weak at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—The market is quiet at 2½c a pound from stores.

NITRATE OF SODA.—The market is slow and in buyers' favor for spot.

Our market is quoted from store at 4c for 95%.

PHOSPHORUS.—The market is easy.

We quote in a jobbing way at 70 to 75 cents per pound.

Mining Share Market.

SAN FRANCISCO, Dec. 9, 1897.

The market ruled heavy, with a slow but gradual decline, up to Tuesday afternoon, when there was a steadier tone, with a slight advance along the line at the close, in sympathy with a 30 per cent advance in Potosi. Wednesday morning the advance was maintained, with the Gold Hill shares, under the lead of Yellow Jacket, moving up a little, but at the close of the day there was a slightly easier feeling. While the writer still holds to the opinion that a strong moneyed pool is manipulating for a bull campaign some time in 1898, yet the market does not act as if they are ready now, although it may be. Judging from the past, more assessments ought to be collected and others levied first so as to freeze all out of their holdings that is possible. Besides assessments, the market ought to be made sicker than ever, with only spasmodic rallies, and to help it along on this line scare reports would be in order, such as closing up the Exchange and selling the building, shutting down of the mines and other equally false information. There has been no deal but it was preceded by some such reports and a very sick, dragging market of several weeks' duration. From all that can be learned it is quite certain that some time in 1898 some very important work will be started at two or more points on the lode, which will have direct bearing on the market for a bull campaign. It is possible that it may not be started until in the spring, yet indications point to an earlier date. It is stated that the returns from the 1000 tons of low-grade ore milled by the Gould & Curry Co. have proved so satisfactory as to induce a test of 2000 tons. If this should prove satisfactory, it is probable that other companies will extract and mill low-grade ore, of which there are millions of tons running from $8 to $16 per ton, mostly gold, particularly in Con. Imperial and neighboring mines.

From the Comstock mines official letters fail to give any news of any importance, but private advices are more encouraging, which is in direct conflict with bear points put out on the street by interested parties. It is the belief in well-informed circles that important delayed work will be started next year, probably toward spring. Some of this work was reported by experts appointed for the purpose. These reports were not made public, simply because members of the moneyed pool changed their minds and thought the time was not favorable for a bull campaign. In Utah they are still drifting in a northwesterly course, with no change reported. They continue to drift north on the 175-foot level in Andes. When exploiting work is commenced good results are looked for. In Sierra Nevada work is confined to three points—the Layton tunnel level, the 900-foot level and running the new tunnel. On the former level they are blocking out the ground and on the 900-foot level they are drifting north. In Union the west cross drift reported last week has been extended 16 feet, making a total distance at last advices of 43 feet. In Mexican they are crossdrifting east on the 1000-foot. The total length is 500 feet. They are out about 650 feet in the west crossdrift on the 1000-foot level of Ophir. The formation is favorable. No change in the work on the Central tunnel level. From Con. Virginia there is nothing new; the work is confined to exploiting on the 1550-foot, 1650-foot and 1750-foot levels. There is nothing new reported since our last issue. Best & Belcher and Gould & Curry are repairing the Bonner shaft. No change is reported by Savage. No work in Hale & Norcross, and none expected until the lawsuit is settled. No change in the Chollar-Potosi joint work. Active exploiting work is being done in Potosi with varying success. They are drifting south on the tunnel level. The same old stereotype advices come from Alpha. In Con. Imperial they are still running the surface tunnel and also the long joint west crossdrift of Con. Imperial, Confidence and Challenge. Favorable advices come from Yellow Jacket, but reports say they want another assessment before the ore will be shown up. It is toward Kentuck. Active exploiting work is being done by Crown Point around the 700-foot level. In Belcher they are crossdrifting east on the 1200-foot level and west on the 850-foot level. Both crossdrifts are important. From Seg. Belcher and Overman nothing new has come to hand. In Justice the work is both exploiting and developing. The management talk quite enthusiastic over the outlook.

Some experts have visited the Brunswick in the interest of large shareholders. It is stated that they are favorably impressed with the lode. In Occidental they are nearing the point where they expect to strike the downward continuation of the ore found above. Strong parties have faith in the mine and are still buying shares. In Potosi and also in Chollar there are no changes to report. The work is on the same levels and directions reported last week. Informed miners are watching the work in Potosi. The joint work by Con. Virginia, Gould & Curry and Best & Belcher is practically the same as reported last week. It is largely of an exploiting character.

The following illustrates the changes of the week:

Mines.	Dec. 2.	Dec. 9.

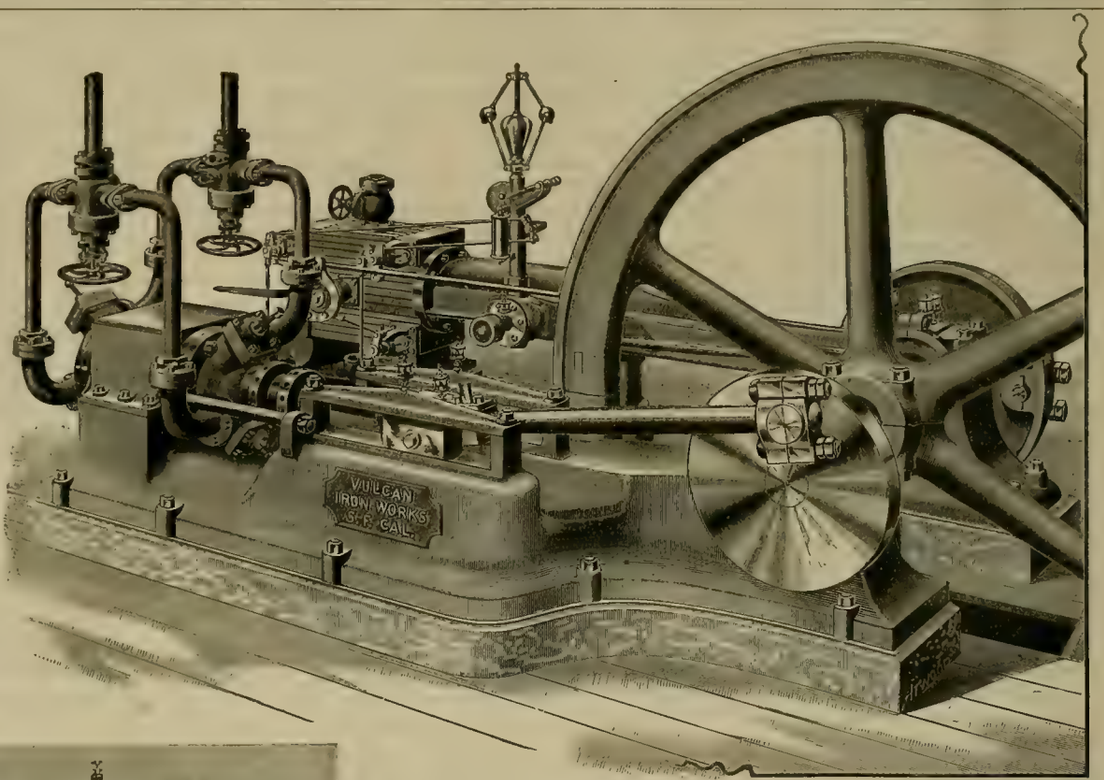
MINING AND SCIENTIFIC PRESS.
AND PACIFIC ELECTRICAL REVIEW.

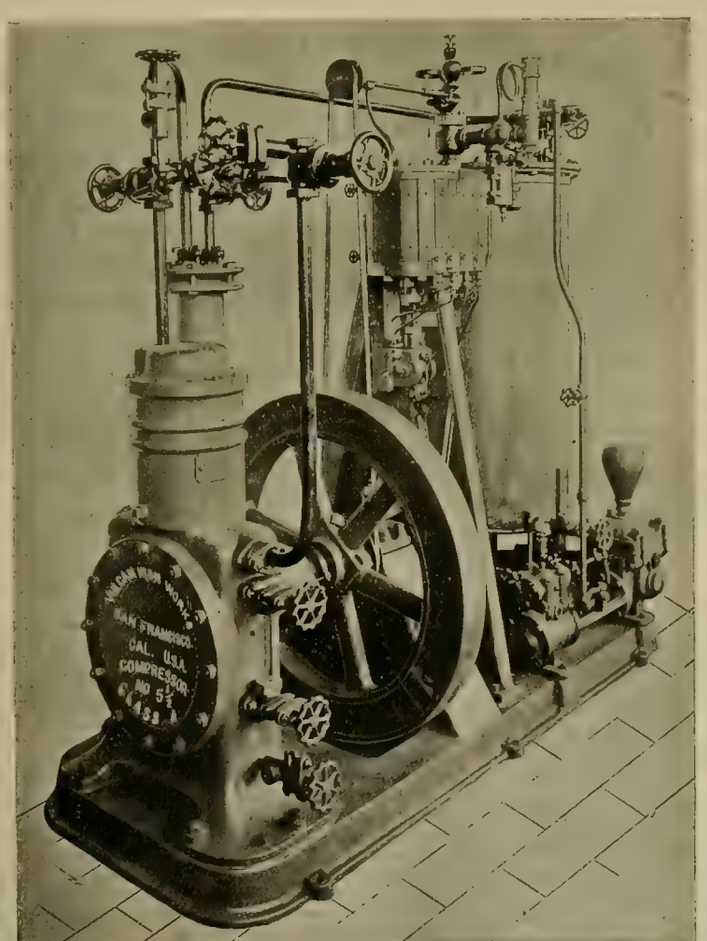
No. 1954.—VOLUME LXXV. Number 25. SAN FRANCISCO, SATURDAY, DECEMBER 18, 1897. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Refrigeration and Artificial Ice-Making.

Although the manufacture of ice in a primitive way is an ancient custom, it is only within the last twenty years that scientific and mechanical progress have so improved the refrigerating and ice-making machine that it has become an established commercial success, and an absolute necessity in many lines of business. These machines are in general use in breweries, packing houses, cold-storage establishments, ice factories, on steamships, up-to-date markets, hotels, public institutions, creameries, etc., and are being introduced in other lines of business. The process now generally recognized as of the greatest efficiency and economy, also of the widest application, is that which uses liquid ammonia to produce the desired refrigerating effect. This process was the one adopted some twelve years ago for the first Vulcan ice and refrigerating machines that were put on the market. One of the first of these machines was furnished to the Hotel Del Monte, Monterey, and this machine has been in constant operation since that time, giving satisfaction to its owners.



VULCAN REFRIGERATING AND ICE MACHINE—TYPE OF LARGE MACHINES.



VULCAN REFRIGERATING AND ICE MACHINE—TYPE OF SMALL MACHINES.

The Vulcan refrigerating and ice-making machine is manufactured by the Vulcan Iron Works of San Francisco, Cal., who have made a specialty of manufacturing ice and refrigerating machines, and about sixty machines of their manufacture are in operation on the Pacific coast and elsewhere, which they refer to as evidence of their success in this line of work. Aside from local machines, the Vulcan refrigerating and ice-making machines are in use in Oregon, Washington, British Columbia, Arizona, New Mexico, Mexico, Guatemala, Salvador, Costa Rica, Hawaii, etc.; also on twelve different steamships. Among their customers may be mentioned the Kern County Land Co., the Hawaiian Commercial & Sugar Co., the Pacific Improvement Co., the Pacific Mail Steamship Co., Goodall, Perkins & Co., the Mountain Copper Co., the Gambrinus Brewing Co., and numerous breweries, packing houses, ice factories, etc., etc.

The Vulcan Iron Works are located at the corner of Francisco and Kearny streets, San Francisco, comprising foundry, machine and erecting shops, pattern and wood-working shops, etc., and when full-handed employ about 200 men. The erecting shop has a heavy overhead crane that travels the entire length of the shop, about 140 feet; the machine shop has a lathe that will turn a wheel 16 feet diameter; the foundry has three cupolas of combined capacity to melt twenty-five tons of iron per day, and other facilities are in proportion for handling large and important work.

The Vulcan Iron Works have built up their present extensive business through a reputation for good, careful work and fair dealing with their customers, and deserve the continued recognition that such a course demands.

It is estimated by Professor Vernon Harcourt that the total quantity of alluvium discharged by the river Hooghly into the sea is 90,000,000 cubic yards annually. The proportion of solid matter to the total discharge of the river, including the clear cold weather discharge, when no alluvium is brought down, he estimates at 1 in 2444, or, including the clear cold weather discharge, 1 in 2000. Hooghly valley residents seem to have a good opportunity to institute a quarrel with the Almighty by organizing an anti-debris association.

Uranium, one of the "rare earths," is now reported discovered in commercial quantities at Black Hawk, Colo. It has of late become of economic value, being principally sought for hardening gun metal and armor plate, and is at present quoted at $2.50 per lb.

WITH the issue of the 25th inst., will be sent to every subscriber a correct map of Alaska, the Yukon region, etc., specially prepared and lithographed for this paper.

SECRETARY OF THE TREASURY GAGE has decided to practically abolish the New Orleans mint after Jan. 1, '98, reducing it to the grade of an assay office. The expenses will be cut from $100,000 to $12,000 per annum.

IN a long communication W. Van Devanter, Asst. Att'y-Gen'l U. S., gives an opinion that locators of mining claims within the Yosemite, Cal., reservation, prior to Oct. 1st, '90, who have complied with all legal requirements, hold unassailable title thereto, and can build and maintain necessary roads. The opinion is approved by Secretary of the Interior Bliss.

ACTIVITY in mining matters contrasts with apathy in some branches of business. Creede, Colo., announces an advance in wages after Jan. 1st from $2.50 to $3 per day. The Chapin Mining Company, the Pewabic Company, the Antoine Ore Company, the Aragon Ore Company and the Pennsylvania Iron Mining Company, of Iron Mountain, Mich., and vicinity have announced a 10 per cent increase in wages to take effect on Jan. 1st. That increase affects more than 2000 men.

MENTION was made in last week's issue of a Colorado suit wherein a tunnel company claimed the right to pass through a patented mining claim against the protest of the owner, who had made the location prior to the location of the tunnel company. The court has decided against the tunnel company, holding that a mining location properly made and maintained could not be the subject of adverse location or operation, which is a pretty good Monroe doctrine for the miner.

REGARDING the report of the Committee on Revision of Mining Laws, recently published in New York City and Denver, a word is due, stating the reason that the report did not appear herein. The report was received at this office, confidentially, with the plainly stated wish that it be not published till "released." The MINING AND SCIENTIFIC PRESS kept faith with the committee, as is its habit in such cases. Ex-Gov. Prince, president of the National Mining Congress, and C. J. Moore, chairman of the committee making the report, together with the other members of the committee, regret the violation of their confidence. The two members named further state that the committee has no authority to present the report direct to Congress, but must first submit it to the meeting of the Congress at Salt Lake City, Utah, July 1st, '98.

California Mineral Lands.

In the United States Senate last Tuesday the mineral land bill relative to Oregon was called up and would have passed with the California measure, without objection, but for the unfortunate fact that Senator Stewart of Nevada, who was temporarily absent, happened to have some inkling of what was going on, and reached the Senate chamber just in time to object. The Senator from Nevada can always be counted on to do something of that kind, and is certainly a faithful representative of the opposing forces, whatever may be said of his rectitude as a representative of public interests.

These mineral land bills have had a difficult career. Much intelligent effort has been given to the entire matter, and twice it would seem as though success was certain; at the critical moment, however, the opposition each time scored a point. Of late but little has appeared in these columns regarding this question. The corporations seem to have their paid attorneys where they will do the most good—or harm. Sometimes, one is retired from Congress by justly aroused public opinion, as recently in Oregon; others, elsewhere, are kept in by skillful corporate influence and legislative inertia. The entire matter is of great importance, more especially to California, and now deserves a little further mention at the close of the year.

California's future as a great mineral producing State is beginning to be appreciated, after a period of long depression. The hard times of the past four years have stimulated prospecting for gold, and the result is that new discoveries are being made, and lands which were supposed to be of no value are proving to be rich in mineral.

While the people of California have been sleeping on their rights, the Central Pacific Railroad Company and its associates have been quietly gathering in some of the best mining ground in the State, as non-mineral land. In this they seem to have been assisted by several of the Commissioners of the General Land Office, who by circulars and various other methods have promoted the object and favored the efforts of the railroad companies.

When the Government surveys public lands it is the duty of the surveyor to report and map out his observations on the ground, whether the lands are of mineral or non-mineral value. In practice these reports usually amount to little. A surveyor passing over the ground once in his lifetime on the out boundaries of each square mile cannot be said to have very definite information as to the mineral character or the possibilities of the lands which he surveys. Ordinarily he would not know the difference between gold and iron pyrites if he should see it on the ground, and when it comes to his opinion as to particular or geological formations and mineral deposits his reports thereon afford but little protection to the miners. The grant of Congress to the railroad companies embraced each alternate additional section for ten miles on each side of the roads, as completed, and excludes all minerals except iron and coal from the grant. As fast as the lands were surveyed the companies applied for patents. They went through a form of furnishing an affidavit of some one in their own employ to the effect that the land applied for was not mineral in character—a mere formality and of no real value as evidence. Where the lands were not actually returned as mineral in character by the surveyor the Land Department took no further steps to determine their character.

Having complied with the Federal and local mining laws in taking up and working their claims, the miners supposed they were amply protected. But, under the Land Office methods, their claims may be patented to the railroad companies and they never hear of it. When the surveyor returns lands as mineral, this return can be disproved in the simplest manner imaginable. First the railroad company files an affidavit of one of its agents that it is not mineral; then a notice, calling upon all persons who are interested in the matter to appear at a certain day at the local Land Office and show cause why the land should not be patented to the railroad company, is published in some newspaper said to be of general circulation in the neighborhood. On the date set the railroad company sends two of its paid agents to the Land Office, who swear that they know the land and to the best of their belief it is not mineral in character.

All of this is very easy to the railroad company, and the chances are ten to one that if there are any miners having claims on the ground they never hear of these proceedings. They are not watching the newspaper advertisements to see what the railroad company is doing. They might not know the description of their land if they should see it in the paper. They simply know that they went on their lands in good faith and under the protection of the mining laws and do not know that their claims have been patented by the United States to the railroad company as agricultural land until the patent has issued.

The absolute necessity for delaying the issuance of patents and the necessity for the most careful investigation before patents are issued have been demonstrated by experience all through the mining regions; for instance, at Randsburg: some of the lands there were surveyed forty years ago, and their mineral character was never known until within the past two years. In other parts of the State the miners have been mulcted and the mining interests of the State seriously injured by undue haste in transferring titles.

There is no remedy at law for the greater part of the conditions that have resulted from our liberal land laws, but there is a remedy for cases where titles have illegally passed to mineral lands. The homesteader or pre-emptor claiming but 160 acres has been watched and brought under the most rigid rules; but the railroad companies have grabbed their lands by the wholesale. General and sweeping affidavits as to the character of the lands from persons utterly ignorant of the subject matter, and with but little knowledge of the lands as to which they were testifying, have been received, and advertisements never seen by those interested have been admitted as a basis for obtaining railroad lands which were known to be mineral and actually being worked for that purpose. As to these lands, it is proposed to try and recover the title. With this end in view, Mr. A. H. Ricketts, a mining lawyer of San Francisco, a prominent member of the California State Miners' Association, and chairman of the committee on mineral lands of that body, has prepared a bill to be presented at the present session of Congress.

The purpose of the bill which he has drafted is to get back from the railroad companies those lands for which they have received patents that were known to be mineral before the patents were issued, and when they have not passed into the hands of innocent purchasers. Such a bill is eminently proper and it would be taking from the railroad companies only those lands which they ought to never have received and which the California Miners' Association sought so strenuously to prevent them from obtaining during Smith's and Lamoreux's administration.

It is said to be the practice of the railroad companies when they receive patents for lands to which they know they were not entitled, to transfer them to some outside party who claims to be an innocent purchaser. A sale of that kind, of course, is a mere subterfuge and can be set aside. The miners generally are determined that the railroad companies shall not hold mining property that never was granted by Act of Congress.

Following is the full text of the proposed Act as drafted by Mr. Ricketts:

An Act to provide for the examination of certain lands in the State of California and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that the President of the United States as soon as practicable after the passage of this Act shall appoint a commission consisting of three persons, all of whom shall be residents of the State of California, whose duty it shall be to examine any lands that have been patented to any railroad company in the said State since January 1st, 1893, when it shall appear by affidavits presented to said commission that prior to the date of such patents the said land had been worked or claimed as mineral lands, or wherein valuable mineral deposits were known to exist. The word "mineral" when it occurs in this Act shall be held to include gold, silver, cinnabar, copper, lead, borax, asphalt, petroleum, oil, salt and sulphur.

SEC. 2. That said commission shall make examination of the lands so claimed to be mineral, and

may also take the testimony of witnesses as to the character of any of said lands and receive any other evidence relating to said matter, and shall have power to summon witnesses to appear before them and to administer oaths, and if it shall appear that any of said lands were known to be valuable because of their mineral deposits, or were worked or claimed as mineral lands when patents therefor were issued, said commission shall report such facts in writing to the Secretary of the Interior; and if it shall appear to the satisfaction of the Secretary of the Interior that the said lands should not have been patented to the railroad company because of their mineral character, then it shall be the duty of the Secretary of the Interior to immediately call the attention of the Attorney-General of the United States thereto; and if the title to said lands have not at the date of this Act been transferred by the railroad company to an innocent purchaser for a valuable consideration, then it shall be the duty of the Attorney-General of the United States to commence suit as soon as practicable in the proper court of the United States to set aside and vacate such patents.

SEC. 3. That the commissioners shall each receive for their compensation ten dollars for each day they may be actually engaged in the performance of their duties, which shall include their transportation and subsistence expenses, and these amounts shall be audited by the Secretary of the Interior and paid monthly.

SEC. 4. That the said commission shall continue in office for one year after its appointment.

SEC. 5. That there is hereby appropriated, out of any money in the treasury not otherwise appropriated, the sum of ten thousand dollars, or as much thereof as may be necessary, to be expended to carry into effect the provisions of this Act, the same to be paid out upon the order of the Secretary of the Interior.

Under the laws of the Association the bill must be passed upon by the executive committee before being submitted for passage by the national legislature, but it is deemed probable that that body will endorse the proposed measure.

THE question arises: "What effect will the Klondike craze have upon California?" Probably a beneficial one. It will bring 100,000 men to this coast, many of whom, sooner or later, will see the superior advantages of California as a gold producing region, and who may ultimately make California their home. San Francisco has prepared a valuable and interesting practical object lesson for the modern argonauts in the shape of an exhibit at the Alaska Trade Bureau, where everything likely to be needed in provisions and outfit is represented. It is thought that the Klondike trade of '98 will occasion considerable local business activity. It is calculated that 3,000 miners will go from California, 5,000 from Colorado, 500 from Arizona, 500 from Utah, 1,000 from Montana and 500 from Idaho. Those going from this section will supposedly be experienced and well equipped.

MOST SATISFACTORY ACCOUNTS are received from members of the committees regarding the progress of the California Golden Jubilee Mining Fair. Sufficient money has been secured to guarantee its success. It has been decided that the Mining Fair will open on January 29th, 1898, immediately after the close of the Golden Jubilee celebration, and continue to February 24th. Already several of the mining counties, realizing the importance of the matter as an appropriate advertisement, have stirred themselves, secured the necessary appropriations, made arrangements for space, etc. Every mining county in the State should be properly represented on this occasion, and it is hoped that all will realize the opportunity. Whatever the degree of experience or information, the Fair will be well worth visiting by every one at all interested directly or indirectly in the mining industry.

ACTING COMMISSIONER OF PATENTS GREELEY has made some important amendments to the rules governing the practices of the Patent Office and they have been approved by Secretary Bliss. These rules will apply to all cases filed after January 1, '98, all cases filed prior thereto being subject to the old rules, and provide that no invention submitted is patentable if it has been described in printed publications two or more years before the filing of the application. Heretofore, if a foreign patent has been taken out before an American patent the term of the latter was limited to the expiration of the foreign patent, which often resulted in the practical loss of many valuable patents by giving them a very short life. The new rules do not make this limitation, but if the period between the two patents is over seven months no American patent will be granted. Heretofore preference in acting on applications was given to inventions deemed of special importance to the Government, especially to the army and navy. Now such cases will be made special only when the department interested is personally represented before the Patent Office and asks for such preference. One year is named as the period within which failure to prosecute will be held to constitute an abandonment of the application for a patent.

Acute Klondicitis.

At the risk of repetition it is desired—perhaps unnecessarily—to warn would-be investors against taking any stock in the wild vagaries of Yukon transportation companies, Yukon investment companies, Yukon navigation companies, etc., which are now forming the usual parasitic attachment to the main craze, which in itself is bad enough. Circulars from all parts of the country, mainly New York, Chicago and St. Louis, and a few from this State, are received, setting forth in the most ridiculous manner preposterous propositions. One in particular received this week seems to be honest on the part of its producers. It is noticed here as being the most promising and least meretricious of any of the brood. From its prospectus it is learned that this company

"Proposes to establish a complete line of river boats, with steam ice train combination, to run between St. Michaels and the upper waters of the Yukon; proposes to purchase two flat-bottomed river boats with stern paddle wheel, size 200 feet long by 25-foot beam, with capacity of 500 passengers and 500 tons of freight; to purchase two steam launches with stern paddle wheel, size 50 feet long by 10-foot beam, with capacity of 24 passengers and 15 tons of freight each, all to be built of iron and steel, and so constructed as to be convertible into steam ice trains for use in the long winter months, the small boats and trains to be used in distributing goods in the various mining camps, the large boats to cost $30,000 each and the launches $2000 each. These ice trains have been thoroughly tested, and are considered as simple and practical as any steam conveyance now in use; they have great speed, and are strongly built, having an abundance of surplus boiler and engine power. The river boats can be converted into ice trains in a few days, which will enable the company to navigate the Yukon river nine months, instead of three months, each year. The company proposes to do a general merchandising business, and will establish trading posts on the Yukon and its tributaries, which will be supplied from general store at Dawson, etc."

It is of course but natural that such a stir as is at present going on in the Eastern States, looking to a wholesale hegira Alaskaward, would incite a multitude of questionable enterprises; and it is but stating the plain truth that to anyone who knows anything of the facts of the situation there is not the slightest likelihood of any stockholder in such silly schemes securing any return but experience on his investment.

When it is said that the above is most entitled to the respectful consideration of any which has, so far, been noted, it will readily be seen how absurdly comical the others must be. Of course, anyone who knows anything at all about it knows that the propositions quoted above deserve to be classed with air ships, wave motors, gold manufacture, and all the other schemes which collectively have about as much tangible effect as a chimera revolving in a vacuum.

The wildness of the Klondike craze on the Atlantic slope and in the central Mississippi valley must indeed be of wonderful dimensions to justify in the remotest degree the birth of such a lot of monstrous schemes in connection therewith as are at present being foisted upon the American people.

WHEN the first rush of poorly-prepared Klondikers started last July, the MINING AND SCIENTIFIC PRESS suggested it was none too soon to begin organizing relief expeditions. By September it was manifest to all that much suffering would result, and when Congress met this month one of the first bills introduced was to afford relief for the misguided multitude starving in the shadow of the pole. Last Thursday the House passed a bill appropriating $175,000, and the Senate the same day passed a joint resolution appropriating $250,000 for the relief of Yukon miners. A conference will be necessary to make the appropriation regular. The next question will be how to immediately make practical application of the money.

For Newer Readers.

Publication of the article on page 573 on the "Modern Barrel Chlorination Process," written by Mr. John E. Rothwell of Colorado, may occasion some surprise to many old subscribers of the MINING AND SCIENTIFIC PRESS, the same as similar explanatory articles on other mining matters have in the past few years, as however correct the information, the necessity for its appearance may be questioned by old-time readers. Such articles, giving practical and technical information on subjects with which many miners are presumably conversant, may at times seem out of place in this journal. The principal reason for their appearance is the present general demand for just such clear, comprehensive information as is contained in Mr. Rothwell's article on that subject, which is not so thoroughly understood by many beginners as old-timers might suppose.

It may seem strange to many readers of this paper that the MINING AND SCIENTIFIC PRESS, which first published full accounts of the leading mining processes, which have been universally in use for many years, should apparently revert to rudimentary information on the same topics. While it is true that for the last forty years the chlorination process has been in operation in this State, and that Mr. Deetken and Mr. Aaron explained this matter in these columns, as other eminent practical miners in other branches of mining business explained their processes herein, yet it must be borne in mind that, in this new era of mining, thousands of men have entered into the field who are not conversant with much that is a matter of old information to older and more experienced men, and that even relative to those points much additional has been recently added. The many letters weekly received at this office testify to the general desire for information regarding matters already well understood by many; and it is for this reason that so much has of late been published that may possibly seem superfluous to some of our readers. In the year drawing to a close a vast amount of information concerning the cyanide process has also appeared herein, covering everything procurable and the latest results from practical workers. So also with hydraulic mining, dredging, etc. Right here, where nearly all that is successful in mining appliance originated, and has been improved, there exists to-day a general demand for plain, common sense data regarding those things. It is the pleasure and the province of this journal to furnish just such information. Mining is a progressive science, and the MINING AND SCIENTIFIC PRESS proposes to be at all times fully in accord with present requirements.

It is also to be remembered that the circulation of this paper is no longer confined to California; for nearly five years past considerable successful effort has been devoted to wide extension of its circle of readers until now its circulation outside of this State equals that within its borders, and the thousands of mining men in this west half of America naturally look to the MINING AND SCIENTIFIC PRESS for all their requirements in the way of mining information.

Mr. Rothwell's article is simple, comprehensive and timely, and the matter is merely referred to here to illustrate the demand for just such information by many earnest men who are comparatively new in the business.

A LONDON gold mine operator writes: "I think, as far as Europe is concerned, practically speculation during the next five years will be much devoted to gold mines, owing to the improved methods of extraction. People, and especially continental investors, are being educated up to this kind of investment, owing to the success of the Rand mines. It is mainly a question of providing sufficient working capital. In no case on the Rand has a mine of any size, which has subsequently proved successful, been opened with an expenditure of less than £300,000 or £400,000. I believe that we shall have a Klondike 'boom' when there is something more in the way of exact information to go on." So far as the United States is concerned, the Klondike "boom" will soon burst, as it deservedly should.

IT is alleged in Eastern dispatches that the effort to form a combination of silver smelters and refiners, to control the price of silver, is not a success; but reports from better informed quarters indicate probability of getting together next month.

Hydraulic Mining.

The miner's inch of water, measured by the rule most in use in California, means the quantity of water that flows from an opening 1 inch square through a 2-inch plank, with a head 6 inches above the center of the orifice, the water being at rest. Different methods of measurement obtain, however, among the several water companies throughout the State, the quantity represented by a miner's inch varying from 1800 to 2600 cubic feet per twenty-four hours' flow. These companies, acting in the start without concert or much theoretical knowledge on the subject, adopted each such system of measurement as seemed most convenient or as fancy might suggest, and, although efforts have been made to establish a uniform rule either by general consent or legislative enactment, this has not yet been effected.

The "duty" of the miner's inch, being the quantity of gravel it is capable of breaking down and carrying off in the course of twenty-four hours, varies according to the character and condition of the material to be handled, grade of sluice, style of riffles, etc., ranging all the way from 2 to 20 cubic yards, the average being about 4.

The average in seven different localities in this State, as estimated by the State Engineer, amounted to 3.6, as shown in the table appended:

Name of Stream.	*Inches of Water Used in 24 Hours.*	*Duty per Inch—Cubic Yards.*	*Amount Moved—Cubic Yards.*
Table Mountain	833,250	3½	2,916,375
Butte Creek	24,000	3	84,000
Feather River	1,259,363	3½	4,407,770
Yuba River	5,458,171	3½	19,103,598
Bear River	1,117,082	3	3,351,246
Dry Creek	44,229	3	132,687
American River	1,914,500	4½	8,615,250
	10,650,595	3.6	38,610,926

The above result, 3.6, is somewhat below the general average in California, rendering it probable that the gravel run off in making these tests was coarse and heavy, if not cemented.

At the Hobson mine, Iowa Hill, Placer county, piping a bank of light gravel, using 500 inches water, on usual sluice grade, and under a pressure of 360 feet, the duty of a miner's inch was found to be 24 cubic yards, elevating here the grade to 18 inches and substituting iron riffles for the rock pavement. The duty was raised to 36 cubic yards, this experiment illustrating the gains due to the introduction of these new factors, the average result of the two trials being 30 cubic yards. Running on coarse bottom gravel, this company under same conditions was able to move only 10 cubic yards.

At the North Bloomfield mine, Nevada county, handling 1,500,000 cubic yards top gravel, the duty of the inch was 5.39 cubic yards, while running on the lower and more indurated stratum, extending to a height of 65 feet above bedrock, the duty of the inch was reduced to 2.34 cubic yards, the miner's inch here being equal to 2.230 cubic feet.

In making choice of a hydraulic property three principal things are to be taken into consideration. First, the percentage of gold contained in the material to be utilized, of which there must seem enough to warrant the expenditure required for the purchase, equipment and cost of working the property, interest on capital invested included; second, water in ample supply, easily available and capable of being delivered in the washing pit under a head that will insure effective piping; and, third, sufficient fall or "dump" immediately below the mine to prevent the tailings accumulating to a troublesome extent, unless, as sometimes happens, the latter can be dropped directly into a stream large and swift enough to carry them away. The above conditions being present, a hydraulic enterprise, well conducted, may be expected always to reach a fair measure of success. If there is timber in or near the mine for making sluice blocks, sluices, flumes, trestles, etc., if it is accessible for teams, not far from railroad or river transportation, and the winter climate is not so rigorous as to form much ice or otherwise interfere with outdoor operations—these, though secondary, are by no means unimportant elements of success.

In making tests of the auriferous gravel to be examined, samples should be taken from every accessible part of it; from open cuts, if any there are made by former workings, and from shafts sunk for the purpose; this prospecting work being carried always to as great depths as practicable, or as may seem necessary. For washing the samples of gravel so obtained, the pan sometimes, though more often the rocker, is employed. Where there exist facilities for using it, and there is much work of this kind to be done, the sluice should be availed of, and even the hydraulic pipe, if the ground has already been opened and equipped for active operations; the point sought to be enforced on the attention of the expert being that he should perform this part of his work with thoroughness and accuracy. For a mistake committed in most other matters there may be found a partial remedy, but to go much wrong here is fatal and irreparable. And yet it is just here that the gravel inspector is apt to be deceived, if he does not deceive himself.

In this State, where all the conditions are first-class, gravel yielding a total of not over 4 cents per cubic yard can be worked by the hydraulic process with profit. As the conditions are less favorable, the grade requires to be higher; nor is it often safe to invest largely where the grade falls much below 6 cents per cubic yard, this being about the average yield of the gravel handled on the Pacific coast. If reports on the Ecuador gold fields may be credited, the deposits there will yield at the rate of 40 cents per cubic yard, but these reports have not been substantiated by actual workings; moreover, the gravel banks of that country are by no means so deep as most of those in California.

A hydraulic property having been acquired and prospected in accordance with the rules above prescribed and proving satisfactory, the next thing to be done is the construction of a ditch for bringing in water for washing purposes. The cost of this ditch will, of course, vary according to size, length, natural obstacles encountered and difficulties to be overcome, these various hindrances, owing to the rugged character of the country traversed by these artificial waterways, being many and formidable.

In the endeavor to surmount these impediments, recourse has been had to structures of various kinds, such as flumes, trestles, open cuts, tunnels, iron pipes, etc., the flume in one instance, where was presented no other practicable way for carrying forward the water, having been bracketed to the face of a towering cliff in Butte Co.

In selecting and locating the line of a ditch the avoidance of the above obstacles should be kept in view, earthwork, where the cost is not too great, being preferable to the building of flumes, especially where the latter require to be supported on elevated trestles, as these structures are comparatively short lived, needing also much repairing while they last. Beside being exposed to the wind and the likelihood of being blown down or destroyed by fire, they speedily decay, their average life not exceeding ten or twelve years. Better, as a general rule, carry your ditch by a considerable deflection around the head of a canyon than build a flume for transmitting the water across the depression encountered by a much shorter route.

But what is of still greater importance in this connection is securing an ample supply of water to continue, if possible, through the summer months, as then, the days being long, work can be prosecuted to better advantage than during other seasons of the year, while the water, warmed by the rays of the sun, promotes the action of the quicksilver, causing it to amalgamate with the gold much more readily than when the water is cold. In this style of mining, water failing, all work is intermitted—a good reason why the supply of water should be made perennial, if possible.

Again, the source of supply should be high enough to command the entire gravel deposit for which it is intended, as well as any other, if such there be, for the washing of which this water might at any time be made available. Being sufficiently high at the start, the ditch, in being carried forward, should be maintained at as great an elevation as practicable, to the end that ample head be insured for effective piping. Through faulty engineering, some of our pioneer ditches, when finished, demonstrated the soundness of the hydraulic theorem that water can not be made to run up hill. It is always desirable that the head of the ditch be located below snow-line and have, as far as may be, a southern exposure. All water-courses on its line should be secured and disposed of in such a manner that they can be emptied into or passed over it, accordingly as this additional supply may be needed or not. The ditch should be furnished with an abundance of waste gates, located at points where the escaping water will not be likely to wash away the ground and endanger the ditch, which, by means of these escapes, can be speedily emptied when a break occurring makes this necessary.

The route of the ditch having been selected with proper care, equal care should be observed in making the survey, in the prosecution of which the size and shape of the ditch and also the grades must be fixed. The character of material to be excavated must be examined; sites for flumes and tunnels determined, and where sustaining walls and trestles will be necessary—in short, all the information needed to enable the contractor to eliminate the cost of building the ditch should be furnished by the engineer and surveyor. While a fall 10 feet to the mile—three-eighths of an inch to the rod—has generally been deemed desirable as insuring a free flow of water, and at the same time protecting the sides of the ditch from excessive erosion, many of the ditches in the mining districts of California have a fall of 15 and some as much as 20 feet to the mile—narrow and deep ditches with steep grades, rather than broad and shallow ones, being here the rule; this rule, however, being departed from where deepening the ditch is likely to involve much additional rock work. Owing to the solid nature of the ground traversed by these ditches a swift current works but little harm. If at any point an extremely heavy grade becomes unavoidable, the water, unless it can be dropped at once, should be shot down through a flume, thereby obviating any harmful washing away of the banks. While all ditches tend to enlarge themselves by the process of erosion, their banks gradually become solidified and thus, through diminished leakage and absorption, their carrying capacity is somewhat increased. In view of the loss of water caused by evaporation, absorption and seepage, it has been suggested that the ditch at its upper end be somewhat enlarged, tapering gradually to its normal size, thereby supplying water to make good the losses occasioned by these several causes of waste, that due to evaporation being very considerable during the California summer.

In length the ditches range from a few miles up to a hundred miles or more, exclusive of branches, the entire ditch system of some of our larger water companies covering a linear extent of nearly 300 miles. Generally the ditches in the counties central to the main gold belt are much longer than in the more northerly counties of the State because of the water supply of the mountains in the latter being so much nearer the mines. The cost of the main trunk of our larger ditches has ranged from $100,000 to $1,000,000, which sums have in many cases been increased from $50,000 to $500,000 for construction of branches. The capacity of these ditches varies from 600 or 800 to 7000 miner's inches—grade from 4 to 30 feet per mile, with an average of about 12 feet.

Notes on Present Western Practice of Metallurgy Economically Considered.

By W. B. Devereux.*

As a rule, only a few metallurgists in the West are able to devote themselves to metallurgical problems pure and simple. It is only in the large custom smelting works that they are relieved from business transactions, and have only to concern themselves with the purely scientific side of the problems which come up for solution, and, of course, it is these great establishments which afford the best opportunities to make improvements, and to try experiments looking toward improved processes. Western metallurgy has for its object the treatment of ores produced in the great mountain region between the Western plains and the Pacific coast, which reaches from the Arctic regions down through the United States and Mexico. It may be truthfully said that the ores from all these regions come to one or the other of the various metallurgical establishments in the United States, and, in addition to these, in the past few years large works have been established in Mexico and in the British possessions on the north. Ores of every possible description come to these works, but it by no means follows that these ores are all treated at the works nearest the mines which produce them. In nearly all of the smelting works of this country ores are constantly coming in from distant regions, owing to the fact of the particular works in question being able to pay a higher price than works nearer at hand. This is due to the fact that a given ore may supply a desirable ingredient for one locality and at the same time be undesirable or unnecessary at another.

A knowledge of metallurgy and metallurgical conditions are necessary for every mining engineer. The two professions of engineer and metallurgist almost invariably overlap in the West, especially in remote districts. The conditions vary so much even in localities near together that the determination of the proper metallurgical treatment of any ore becomes a problem of the greatest nicety. Of course, where mines are within reach of large custom works, the metallurgy of the mine is of little importance, although the mine manager must know the value of ores from a smelter's standpoint, in order to so mine them as to obtain the best returns. But there are thousands of mines which are so far distant from metallurgical centers that the questions of transportation preclude the shipment of ores, except where the values are very high, and hence local treatment becomes a necessity. Those who are called upon to pass upon these problems and to carry out the plans ultimately adopted, must have not only a knowledge of general metallurgy, but of a thousand other things which are no part of metallurgy itself. In fact, there is very little information which will not, sooner or later, be found useful.

Suppose one were to consider the possibility of smelting an ore at a distance from the railroad in one of the Western deserts. One of the first requisites to determine would be the available supply of water. There might be available a stream which would contribute no water in the dry season and a flood in the wet. Storage reservoirs might therefore be a necessity, and this would involve extensive engineering knowledge. Long distance pumping might be a necessity from which would arise another sort of problem.

There might be an underground current in the bed of the stream in the dry season which would furnish the necessary water, and this could only be determined by sinking wells. The available supply of timber and its suitability would be another factor, also the relative cost of coke, coal, and charcoal. If fuel was to be brought in by rail, knowledge of railway conditions might materially affect the rates of transportation ultimately decided upon. At the same time, the question of wagon transportation would determine an important proportion of the total cost of fuel, and, in addition, the cost of

* Condensed from School of Mines Quarterly.

getting the product of the works to its destination.

It would hardly occur to one as a first experience that the fact of grass growing along the line of the wagon road, and being available throughout the year, might determine the question as to whether ore could or could not be smelted at the mine in question, or that the price of hay and oats might determine the amount of profit or loss. And yet just such conditions as these are determining to-day the profit and loss account of active mining operations. The reason of this is very simple. If grass is available for feed, freighting can be done with oxen, which are turned out at night to graze. If no grass is available, hay and grain must be fed, and the price of freighting is correspondingly greater.

(To be Continued)

The Modern Gold Chlorination Process for the Treatment of Gold Ores.

Written by JNO. E. ROTHWELL, Denver, Colo

Chlorination is the dissolving of gold out of its ores. The chlorination process is based on the fact of the solubility of gold in a solution of the element chlorine and water.

The Modern Barrel Chlorination Process.—The modern barrel chlorination process is so called to distinguish it from the method of chlorination first employed by Plattner, in 1849, on oxidized residues from arsenic production works, and a similar arrangement on a larger scale put in operation by the late Mr. G. F. Deetkin in California in 1857, and at a later date by the late Mr. C. H. Aaron on the mineral concentrates resulting from concentration of the tailings of the free milling gold ores, this process being carried out in leaching tanks of comparatively small daily capacity; also from the method employed by Dr. A. Thies, in which similar concentrations are treated in small revolving barrels, also of limited capacity. The beginning of the modern barrel process dates from 1890, in which year the process was put in practical operation by the writer on a large scale on the ores of the Golden Reward Mining Company at Deadwood, South Dakota. The ores to be treated were not amenable to either free milling or concentration, and had to be treated in bulk as mined, therefore requiring methods for the economical handling of large amounts of material, in a region where labor and supplies were expensive.

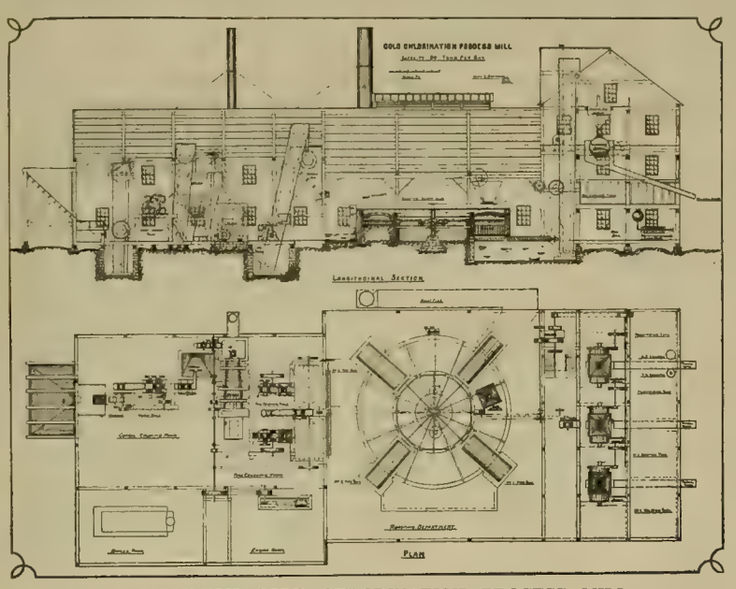
There are no patents on the process, and therefore no royalties to be paid to anyone.

Description of the Barrel Chlorination Process.—The ore from the mine is received in ore bins of reasonable capacity, and from them is fed by hand to a rock breaker, where it is crushed to 1½-inch cubes, and from thence passes through heavy, coarse crushing rolls, in which it is reduced to a 2 mesh, or ⅝ inch, and finer product. In the event of the mill being a custom mill, that is, one that buys the ore from the miner, the ore is now sampled either automatically or by hand quartering, after which it is trammed to a bedding floor, where all classes of ore are mixed to a uniform product. In the case, however, of treating the ore of one mine this extra work is omitted and the ore, after being crushed in the rolls, goes direct to a storage bin having one-half the daily capacity of the plant, so that all the coarse crushing is done on the day shift. From the storage bin the ore is fed automatically to a drying apparatus, and from thence goes to the fine crushing department. This department consists of fine crushing rolls, belt elevator and sizing screens.

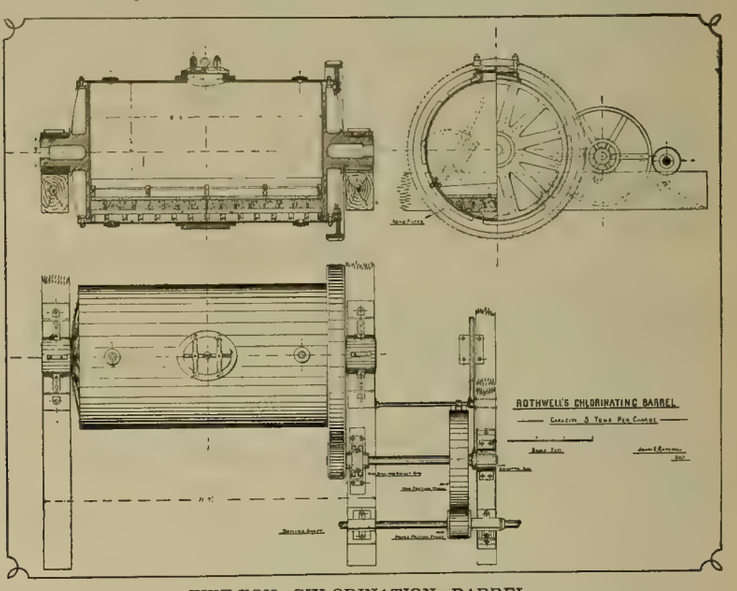
The prepared pulp, the size of which has been determined beforehand by tests, is stored in bins, and from them is automatically fed to the mechanical roasting furnace of the cylindrical or hearth type, the object of the roasting or calcining being to eliminate volatile and enclosing substances and leave the gold free, in a metallic condition, in which condition it is soluble in chlorine water solutions; also to convert what would otherwise be chlorine decomposing minerals into insoluble compounds, and also to improve the leaching quality of the pulp being treated.

The ore, after being roasted, is cooled automatically and conveyed to bins or hoppers directly over the chlorinating barrels, each hopper holding exactly the amount required to charge the barrel.

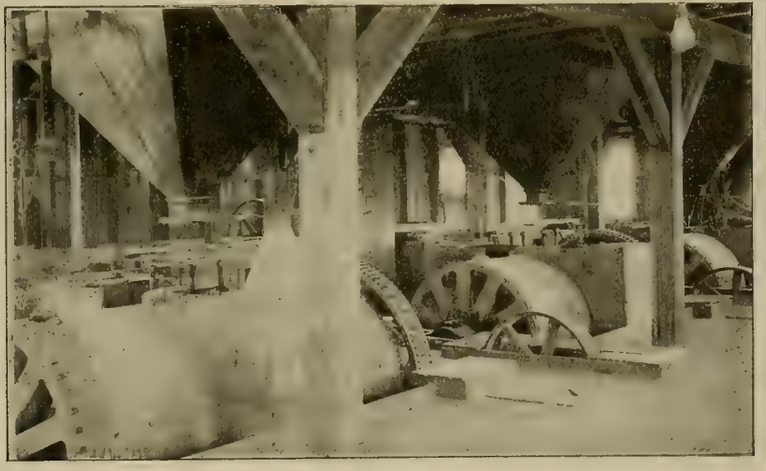
The chlorinating barrels are cylindrical, sheet steel vessels lined with sheet lead. They are arranged to be revolved either on trunnions or encircling tires. The sizes vary from three to twenty-five tons capacity per charge each, to suit the ore and the capacity of the plant required. Each barrel is fitted with an internal filtering diaphragm, to separate the gold chloride solution from the pulp after chlorination.



FIFTY-TON GOLD CHLORINATION PROCESS MILL.



FIVE-TON CHLORINATION BARREL.



BARREL ROOM IN FIFTY-TON CHLORINATION MILL.

In operation the roasted ore is charged into the barrel, with sufficient water to make a liquid pulp, and a weighed quantity of chloride of lime (bleaching powder) and sulphuric acid added. It is then closed tight and the whole mass agitated and mixed by revolving the cylinder slowly. After a certain length of time, from one to four hours, as found necessary by preliminary tests, the barrel is stopped and the gold chloride solution is drawn off through the filter, assisted by air or water pressure, and collected in lead-lined tanks. A precipitant, usually hydrogen sulphide gas, is added to the solution, and the gold precipitated and collected in a filter press in the shape of a sulphide cake. This is dried and roasted to eliminate the sulphur, and the residue charged into a crucible with the necessary fluxes, melted and cast into a bar or ingot of comparatively pure gold. In the treatment of concentrates from the stamp mill or otherwise these are handled in the same way as the ore in bulk, the operation starting with the roasting process.

Chemicals.—The chemicals required for the process are sulphuric acid, chloride of lime, sulphide of iron and sulphur. Sulphuric acid is shipped in drums of sheet iron of about 1600 pounds each; also in tank cars, similar to oil tank cars, of 24,000 to 50,000 pounds. The price of acid varies from 90 cents to $1.10 per 100 pounds at the chemical works. Chloride of lime is put up in sheet iron drums of 500 pounds each; also in casks of about 1200 pounds. The present New York quotation for it is $1.80 per 100 pounds. Sulphide of iron can be purchased in casks of about 700 pounds at a cost of $3 per 100 pounds, or can be made on the ground from crude sulphur and wrought iron. Sulphur can be purcasks of 300 pounds at a cost of $2 per 100 pounds.

Application of the Process.—The process can be used to treat: (1) All classes and values of siliceous oxidized gold ores; (2) concentrates from the concentration of tailings of free milling gold ores; (3) telluride gold ores; (4) iron and arsenical pyrites, zinciferous and antimonial ores carrying gold; (5) ores that will not concentrate effectively and do not carry over 3 per cent copper or 5 per cent lead, and are not excessively high in alkaline minerals; (6) siliceous tailings carrying a valuable quantity of gold. The process saves gold values only. Silver can be saved when this process is used by an auxiliary method.

EXPENSE OF RUNNING A PLANT OF 75 TONS DAILY CAPACITY.—CUSTOM MILL.

LABOR.

Where Used.	*No. Men.*	*Occupation.*	*Shift Hours.*
Mill at large	1	Superintendent.	
	1	Assayer. (Will also take charge of mining operations when mine is in connection with mill.)	
	1	Assayer's helper.	
	1	Bookkeeper.	
	1	Night foreman	12
	1	Machinist	10
	1	Carpenter	10
	2	Roustabouts	10
	1	Night watchman	12
Crushing and sampling	*2	Carmen	10
	1	Crusher man	10
	*1	Sampler	10
Fine crushing	2	Roll men	12
	2	Oilers	12
Engine and boiler	2	Firemen and engineers	12
Roasting department	2	Firemen	12
	2	Feeding and cooling and delivering ore to chlorination depar't	12
Chlorination department	2	Headmen on barrels	12
	2	Helpers on Barrels	12
	1	Precipitator.	

FUEL.

	Coal or *Wood.*
For power	3 to 5 tons. or 6 cords.
For roasting	8 to 9 tons. or 9 to 10 cords.

The amount of fuel required for roasting varies with the character of the ore and the roasting apparatus installed.

CHEMICALS.

		Lbs. per Ton.
For chlorination	Chloride of lime	10 to 12
	Sulphuric acid	15 to 25
	Iron sulphide	1
For precipitation	Sulphur	¼
	Sulphuric acid	2½

*Men marked thus are not required when the mill is treating the ore of one mine.

Miscellaneous supplies, including assay materials, fluxes, filter press cloths, lubricating oils, incandescent lamps, etc., can all be covered with a charge of 12 cents per ton. Renewals and repairs will cost, depending on the location of the plant, from 15 to 30 cents per ton. The amount of water required can be safely estimated at 500 gallons per ton—for steam power and chlorination. This can be reduced if settling tanks are added, and water used over again.

Mining Summary.

CALIFORNIA.

Amador.

One of the results of the attachment recently levied upon the Plymouth Con. M. Co's. property at Plymouth is a sheriff's sale of the ditches, land and mines owned by the company in Cosumnes Township, on December 27th. The suit was brought by H. G. Stevenson to recover $27,468.73.

Record: The tailings of the Belden, which have yielded $30,000 to the cyanide process, are to be worked over by the same parties and the same process.

The case of the Argonaut vs. Kennedy was argued in the U. S. Circuit Court last Monday, on plaintiff's motion to remand the case to Amador county. Plaintiffs want the case tried in Amador.

The Centennial near Plymouth is unwatered. Sinking will be resumed. The shaft is 350 feet; it is intended to sink to the 1000 level before starting a drift.

Work continues on the Pocahontas near Drytown.

Record: At the Central Eureka the shaft is 950 feet and sinking is progressing.

At the Potazuba drifts are being run on the ledge at the 500-foot level north and south.

Supt. Ross begun work on a new shaft 1000 feet east from the present Wildman hoist. It will have three compartments, to be sunk to a depth of 2500 feet, which will reach 1300 feet below the deepest workings. A temporary hoist is to be erected for use this winter.

A $20,000 brick from the Argonaut 40-stamp mill was the result of cleaning up from the outside plates in twelve days run.

Butte.

The Supervisors have appropriated $600 for an exhibit at the Golden Jubilee Mining Fair.

The company owning the Katskill at Bangor has decided to run a three-mile tunnel to tap its blue gravel lead.

The Big Butte is taking out quantities of ore; thirty men are employed.

The Hooper M. Co. have their ditch and flume completed. Work is resumed on the mine.

Calaveras.

Prospect: The Mountain King, near Copperopolis, is bonded to a Chicago company. Work commences at once, and a 20-stamp mill is to be erected within six months. All these properties have been developed and the ore showing is good. On the Mountain King there is a shaft 270 feet and one of the conditions of the bond requires that this shaft shall be sunk 230 feet deeper. On the Big Seven there is a shaft 110 feet and also a tunnel. The Homestead has three tunnel developments—one 275 feet deep, another 65 feet and the third 40 feet.

Chronicle: Col. Robinson has purchased the Spanish Bar and Bloomer placer mines on Mokelumne river, which will be operated by hydraulic elevator.

El Dorado.

(Special Correspondence).—A. E. Head & Co. have given a short bond on the Blue Gouge to an Eastern company. The property comprises fourteen claims, is well wooded and watered and has considerable development work. It is a low-grade proposition, but possesses every desirable advantage for cheap mining and milling. It is twenty-six miles east of Placerville.

Placerville, Dec. 14th, '97.

The Larkin's clean-up last Monday from five stamps was $1770.

The Newton gravel mine, ninety-seven acres, with 10-stamp mill, was sold last week by C. H. Clark of San Francisco to I. N. Proctor, M. D. of Placerville.

The 10-stamp mill on the Big Sandy, at Kelsey has been in operation for some time, and the returns are satisfactory. This mine is owned in Toledo, Ohio. J. T. Kelly is Supt.

J. D. Murphy has resumed operations on his placer mines in Kelsey district. He will operate on a large scale.

At Greenwood Lee Bros. are down 100 feet on their mine, and drifting on.

At the Ohio the force of men has been increased.

A. Gerard is completing a 20-stamp mill on his property a few miles below Placerville.

C. R. Wallace of Georgetown, Supt. of the Bright Hope, one mile east of Georgetown, is putting up a mill on his mine.

At the Grover Cleveland a ledge 9 feet wide of $5 ore is said to have been discovered.

Placerville citizens have petitioned the County Supervisors to appropriate $500 for the Golden Jubilee Mining Fair.

Humboldt.

The black sand mining plant near Little River beach was wrecked last week. During the storm breakers cut their way through the sand dunes behind which was located the mining plant, destroying the water-wheels used for driving the machinery, carrying away the piping, demolishing buildings and filling the pit from which the auriferous sand is taken with water and wreckage.

Inyo.

Supt. McDonnell on the line between Inyo Co., Cal. and Nye Co., Nevada, has a 20-foot ledge at a depth of 120 feet, and is erecting a 20-stamp mill.

P. Geelhoed and H. S. Kennedy have two locations near Benton, one showing a ledge assaying gold and silver.

Kern.

(Special Correspondence).— On the Gold Hill, incorp., the deepest shaft is 70 feet on a 2-foot ledge of $60 ore. A tunnel on the ledge is 270 feet. The company owns six claims. The property is in the Rademacher district, fifteen miles from Johannesburg. E. Bind is superintendent.

Johannesburg, Dec. 13th, '97.

B. Maginnis and S. J. Montgomery have struck a ledge on the Annex that mills $47 per ton.

The Visalia mill started its pumps last week.

T. Bull has bonded a half interest in the Pinmore from F. W. Clift and F. G. W. Spencer for $3000.

A mill test of 29 tons from T. Pheby's mine in the Panamint yielded $15 per ton.

Randsburg *Miner*: From 6240 pounds of ore W. J. Bryan obtained 7⅛ ounces of gold.

J. A. McCusker has uncovered a 3-foot vein on the King George. The rock mills $48.

Mariposa.

The Mount Gaines, under bond to G. Crocker, is down 600 feet. In the bottom there is a 5-foot vein. In another part of the mine they have a 2-foot vein from which a milling test averaged $25 per ton. M. L. Rogers is superintendent.

The Boston News Bureau of the 6th inst., says: "The Merced Gold Mining Co. has secured the $60,000 wanted for development of the Mary Harrison vertical shaft, and more can be obtained if required."

The following is from the Boston *Herald* of the 3rd inst:

"A loan of $60,000 at 6 per cent is being arranged by Merced mining people, the money to be used to sink the Mary Harrison vertical shaft and connect it with the old incline shaft. An assessment may follow if the openings are sufficiently favorable. Why not the assessment first? Some shareholders would prefer to pay an assessment and keep the company out of debt. A debt is a bad thing for a new mining enterprise. How about Merced profits from operations lately reported? Are they insufficient to earn other profits? An official and definite statement about Merced would shed needed light on the situation."

Mono.

Despite the act of the last Legislature abolishing mining district recorders, etc., a district to be known as the Black Lake mining district has been organized, running six miles west, north, east and south to place of beginning, six miles northwest of Benton.

Nevada.

(Special Correspondence).—The 10-stamp mill rebuilt on the Gaston Ridge mine for prospecting purposes, began operations last week and will run all winter. There are 1800 tons of ore on the dump. Dana Harmon is superintendent.

Graniteville, Dec. 16th, '97.

(Special Correspondence).—R. K. Schockley, Supt. of the Phœnix M. & I. Co., Nevada City, Cal., is lowering the water in the old shaft by an ejector at the rate of an inch per minute. This property is the old Sneath & Clay, renamed by the new company the Phœnix Mg. & Impr. Co. The owners are Eastern people excepting Dr. A. H. Tickell of this city.

Nevada City, Dec. 14th, '97.

McHugh, O'Hearn & Co., at Grass Valley, have leased the New Eureka Mining Co.'s mill for their claim, which produces ore valued at $8 per ton without sulphurets.

The Mistletoe, near Rough and Ready, has reached a depth of 50 feet. The ledge ranges from 3 to 8 feet.

Supt. Kirkham of the Mountain Chief has begun cleaning and extending the old tunnel.

The expenses in October of the Brunswick were about $3,450, receipts $4,400. There was milled during October 390 tons of ore. Supt. Mallen says work at that mine is progressing well. There is considerable fair ore in sight and it is expected that more will soon be uncovered.

The South Fork Co.'s mill at Graniteville has closed for the winter.

At the annual meeting of the Gold Point C. G. and S. M. Co., Jas. Watt was elected Supt.

The new mill at the Reward was started this week.

Telegraph: The Red Dog M. Co. has been granted a permit to hydraulic.

Telegraph: The clean-up made last week from the No. 5 level of the Illinois mine from thirty-four loads was $32 per load.

Placer.

The Herman, on the upper Forest Hill divide, has been in successful operation for two years.

On the Page & Buckman the crosscut tunnel is 300 feet. The ledge is from 5 to 8 feet. The ore averages $5 per ton.

Supt. Wilkerson has six men at work in the Green Mountain, at Crescent, cleaning tunnels, etc.

Herald: The hoisting works at the Marguerite is completed. The company intends sinking the new shaft, which is 165 feet, to a depth of 500 feet before crossing to the main ledge.

The Mountain View, near Auburn, has resumed operations, W. A. McNaughten of Oakland having contracted for the purchase of the property.

Independent: C. E. Pike has completed the debris dam for the Upper Dutch mine.

The Claybank Co., A. Moore, Supt., is extending its main tunnel.

Sentinel: The French company owning the Red Point gravel mine have sixty-seven men on the payroll. About 135 cars of gravel per day are brought to the dump. Seven horses are used in pulling trains. The company is in the channel a distance of over 11,000 feet. Forty-seven miners' inches of water flow from the mine. This is taken up with a pipe at a distance of 4000 feet in the tunnel, giving 90 feet pressure, which is used to drive the blower. The company has secured estimates for an electric plant and have taken the matter under advisement.

At the Herman mine, near Westville, Supt. Barton says the pay chute in tunnel No. 3 has been worked 290 feet on the ledge. Tunnel No. 5 is in 400 feet.

San Diego.

Several mines near Fallbrook have been sold to a company. Four of them sold for $8000.

The *Union* reports the recent location of large deposits of gypsum on the desert, twenty miles southeast of Borrego springs.

San Bernardino.

A strike of gold-bearing ore has been made within ten miles of San Bernardino.

Shasta.

The Diestelhorst dredge on the Sacramento river is operating about three miles above Redding. The engine is 20 H. P. and raises an average of two and a half tons of gravel per minute. The largest piece of gold taken from the river averages $5. The dredge is in operation day and night, and five men are employed.

Taylor brothers have been prospecting in western Shasta and claim to have found a ledge 4 feet in width assaying $100 to the ton in gold and $5 or $6 in silver.

The Keno is under bond to Oakland men for $3000. It has a tunnel 300 feet following a 2-foot vein. A shaft has been sunk 40 feet. Both the shaft and tunnel will be continued until they meet. The ore is said to assay as high as $80.

Stoddard & Watts are at work on a crosscut tunnel 200 feet, which will tap the ledge at a depth of 100 feet.

Salee & McDonnell, at Copper City, have completed the new tunnel started two years ago. It is 1400 feet in length and crosscuts the ledge at a depth of 400 feet. The ledge is 6 feet. The ore is base and carries gold, silver and copper. Two carloads were shipped to the smelting company at Vallejo Junction; one car netted the sum of $422, the other car gave a net return of $445.

Last week two buckets of earth on W. Murray's ground, near Shasta, is said to have yielded $26.

Sierra.

(Special Correspondence). In the Lucky Dog Gravel mine the grade in the tunnel has finally been overcome, and the 600 foot tunnel, cutting through bedrock, partly, is into 4 feet of gravel that is paying $3.25 per car. The property is owned by San Francisco people. J. D. Jones is Supt. This is one of the three extensive gravel properties about Forest City operated under the general management of F. W. Page.

Forest, Dec. 10th, '97.

The Copeland-York started the mill and pump last week.

W. York & Sons have traced their ledge across the river and also done work on a new location. They have completed their arrastra.

Siskiyou.

D. N. and C. E. Custer of Montana have a ledge in Quartz valley, eighteen miles from Yreka, with a tunnel 300 feet long, and 380 feet of backs. The ledge is pockety, and these pockets yield from $600 to $1000 in gold. On the ledge between these pockets the ore is said to average $15 per ton. They have a 5-stamp mill.

Most of the placer mines in the Salmon river section have started up.

The Spangler Bros. claim at the mouth of Humbug creek is well supplied with water and has begun work. A double-action Westinghouse engine is used for hoisting.

A large amount of snow fell on all the mountains and mining in this county will be unusually active this winter. The big plants on the Klamath will accomplish a great deal of work this winter, several of them being already in operation.

Trinity.

(Special Correspondence).—The Bloss and McCleary hydraulic property comprising 1,000 acres situated at the edge of this village is sold for $53,000. The purchasers are L. McDonald, J. Porter and four others. L. Reel, one of the purchasers, will be superintendent. Work is already in progress.

Trinity Center, Dec. 13th, '97.

A tunnel in the Boulders, owned by G. L. Carr, is in 250 feet. He expects to crosscut the ledge by running 400 feet farther.

Tuolumne.

The mill on the Gerrymander has been completed and will start as soon as the delayed pipe arrives and connection can be made with the canal. The property is owned by Oakland and San Francisco people.

The marble quarry near Columbia has been leased to Poniatowski & Bullock of the Sierra Railway Company for ten years, with the privilege of buying the property. The price is said to be $200,000 and the lease $7000 per annum.

The Pennsylvania mine has been unwatered and Supt. Nagle is putting in a first-class hoist.

Independent: The ore recently struck at the Marble Point assays $800 per ton. This mine was bonded by its present owners for $8,000.

The 20-stamp mill at the Shawmut has started. Ninety men are employed.

The Gold Bug has decided to sink another 100 feet; a steam pump will be immediately put in to relieve the shaft of water.

The Columbus is drifting north from its lowest level and extracting ore.

Democrat: On the Estrella a tunnel taps the ledge at 140 feet and 50 feet of vein matter has been gone through, all of which will pay to mill. Assays vary from $30 to $200. D. Y. Browne is Mgr.

The old shaft on the New Era has been cleaned and sinking commenced. At 50 feet the vein shows 3⅝ feet of quartz.

The new shaft on the Grizzly has reached 200 feet; the vein shows from 6 to 18 feet of quartz that mills from $10 to $12 per ton. Supt. Sharwood says there is rock in sight to keep a 20-stamp mill jumping right along.

Ventura.

A 2-stamp mill has been erected at the mine owned by T. J. Harris & Bros. The first run of twelve tons produced $300.

Yuba.

T. A. Phillips, director of the Florida Central Railway, and M. V. Raley, Gen. Supt. of the road, are at Indiana Ranch to inspect the Good Title mine and new mill, in which they are interested. J. E. Poingdestre is the Gen. Mgr.

NEVADA.

The Gold Eagle, near Winnemucca, C. H. Wilbur Supt., owned by Utah people, within the last few months shipped 800 tons of gold and silver ores, which netted $100 to the ton. Ten men have been employed for two years.

At Eppenger & Griswold's soda works at Soda lake, Churchill county, they run a twelve horse team between the lake and Desert, a station on the C. P., five miles east of Wadsworth, making four trips a week. At the lake they are fitted up with pumps, vats, etc., to pump the water into the vats and extract the soda by solar evaporation. It takes all summer to work a vat and 25 vats produce 500 tons of soda. At Little Soda lake, F. Small is operating a small plant.

Eureka *Sentinel*: The new mill and cyanide plant at Lane City are in operation. The stamps were started Tuesday; the cyaniding branch commenced its work on Wednesday.

The Thorpe mill at Lewis has been closed down after running a month. The ore is silver and so low grade that it did not pay.

The concentrator plant of the Glasgow M. Co. at Golconda was started for a trial run this week.

Eureka *Sentinel*: The mill and cyanide plant at Lane City are in full and complete operation.

OREGON.

Three miles north of Cape Foulweather, on the ocean beach, are the placer black sand mines of B. F. Jones of Toledo. There are three claims, lying between two small creeks running across the beach. The paying sand lies in a strip three-fourths of a mile long, 300 feet wide and about 5 feet deep. The mine is operated by water brought in ditch and run through the old-fashioned sluice box. The bottom boards are from logs sawed in a line oblique to their length so as to expose a rough grain the whole length. As the sand is washed through the sluice box, the rough, fuzzy surface of the boards catches more or less of the fine, flour-like gold. There is scant water for operating the sluice, but after improvements in contemplation are made there will be an abundance. In the present poor state the claims pay good wages. The last work was done last April, when three men and team in twenty days' work, ten hours a day, washed out gold to the value of $208 and also ten ounces of platinum. The value of the platinum itself insures fair wages. Capt. Jones says the gold is given a standing of 18½ fine at the mint, where he has sent the most of that taken from the claims. Aside from this there is no belt of black sand in paying quantities on the Oregon coast north of Alsea bay.

A New York company, represented by J. Johnson, bought eight developed claims near Baker City.

W. Cable is Supt. of the Climax mine, Baker City, upon which a tunnel 400 feet in hard rock has been run.

W. J. Connors, Mgr. of the California Cable Cove, Josephine county, has his new 10-stamp mill completed.

An Eastern company is developing the Silver Gem.

At Hanover an Eastern company is developing on the Lynch Tabor properties.

Union county, it is estimated, this year will produce $2,172,000 of gold; Baker county, $2,000,000 and Grant counny, $200,000, making the total for three of Oregon's leading mining counties nearly $4,400,000, and that when full reports are in from Douglas, Jackson and Josephine counties, Oregon's gold product for '97 will reach nearly $5,000,000.

The *Observer* says the shaft on the Black Pocket near Grants Pass is 30 feet deep and has paid $100 per foot.

The Champion near Ashland has been sold to J. Woodruff of Chicago, for $10,000.

BRITISH COLUMBIA.

(Special Correspondence).—The Cariboo Gold Fields', Ltd., pipe line and elevator are in place, the drain tunnel completed and everything ready for active work next season.

The Dragon Creek M. Co. is developing a fine hydraulic property under the management of Gus Lange. The head of sluice will be on bedrock next year. Last winter the ground was prospected by drifting, exposing gravel carrying as high as 2 ounces per cubic yard.

Laird on Willow river, Hopp on Slough creek and Dow on Big Valley creek are drifting with from fourteen to twenty men each.

The drain tunnel on Hardscrabble is in 1100 feet, and Manager Fry expects to strike bedrock and pay gravel very soon. Fry, who recently bought Henry Boursin's lease on Cornish creek, has men at work sinking a shaft there.

John Pomeroy and Henry Boursin have bonded a lease on Canadian creek to John Kavanaugh for $2400.

McGregor & Thompson are drifting 2-oz. ground on Cunningham creek.

Hassock & Hansen are getting fine prospects on the property of the Devil's Lake M. Co., Ltd. They expect to strike the channel and big pay a few weeks hence.

The Oriole Syndicate, Ltd., is having a test by the cyanide process of 50 tons of ore at the Government reduction works. The Syndicate's property is on Lowhee creek.

Ogden & McKenna made an ounce per day per man shoveling in during the fall freshet on their claim at Eight-mile lake. Jacob Sherman, on the adjoining claim, has struck $5 rocker diggings, and is now running a tunnel to prospect his ground.

Barkerville, Dec. 10th, '97.

The Le Roi is now working at its fullest ca-

pacity, 245 men. Supt. Hall will raise 200 tons of ore daily. Sinking the main shaft to the 700-foot level has begun.

The mineral exports of southern Kootenay for November was $824,362, $10,000 short of October. The value of exports for the month are classified as follows: Gold, $300,514; copper, $88,454; lead, $86,719; silver, $348,675. For December the exports for the first four days aggregate 2110 tons of ore and matte, valued at $213,563.

R. J. McKenzie has taken a bond on the Enterprise, Anchor and Lake View in Long Lake camp for $50,000.

An English company has bonded the Athelton claim in Wellington camp from Mack brothers for $15,000, paying 10 per cent cash.

Number One mine on Red Mountain, Rossland camp, is sold to an English syndicate represented by A. Dick of Rossland, for $200,000. Number One is an undeveloped prospect but has a fine surface showing.

ALASKA.

In Helm bay, southeast Alaska, a stamp mill will be erected on the Gold Standard group of seventeen claims on Cleveland peninsula, sixty miles south of Fort Wrangel. The locations embrace five parallel veins.

H. G. Blackwell of Spokane, F. N. Gove and associates have bought 240 acres of placer ground on Indian creek, a tributary of Turnagain Arm inlet. The deal involves a purchase price of $100,000. It is a hydraulic placer proposition.

UTAH.

The new mill for the Last Chance, Bingham, replacing one destroyed by fire in August, is completed. J. P. Turner is Supt.

The Old Jordan and Galena, Bingham, is said to be turning out ninety tons per day, the concentrates containing 30 per cent lead, 25 per cent iron and from 7 to 10 ounces silver. A. Mayberry is the Supt.

G. S. Peyton of Salt Lake City, and Eastern associates secured control of undeveloped ground in the great Mercur gold district, being the Overland group of nine claims, all patented. Mr. Peyton immediately after the New Year will commence work with as large a force as necessary, his intention being to get the property in shape to maintain a heavy extraction for a plant to be erected in June or July. As has often been told, Mr. Peyton was the first to introduce the cyanide process in the recovery of gold in Mercur.

The West Mountain Placer M. Co. and the Watson & Chandler P. M. Co. of Bingham, Utah, have consolidated.

The Mercur *Miner* says Col. Wall has bonded the Hecla and $2000 has been paid on it.

P. and H. Morgan, stockholders of the Morgan Silver M. Co., have disposed of the bulk of their stock, which is now in control of Walker Bros. and J. J. Daly. The Morgan Co's. ground consists of ten patented claims, near Park City.

J. Y. Hale, representing Pittsburg men, has a $10,000 bond on the Golden Eagle at Albion.

A placer mining deal between E. C. Spicer and R. J. Anderson is closed. The property is on Boise river. The price is understood to be $20,000.

Tribune: The concentration of high-grade copper matte is now going on at the Hanauer smelter. There are about 400 tons of it in stock, and this will be handled at the rate of 40 tons a day.

IDAHO.

The Golden King M. Co., Elmore county, has closed a contract for a cyanide plant of fifty tons capacity. D. Reher of Mountainhome is Mgr.

Latest statistics of the Boise assay office is the report of Assayer Church for 1896, which gives the gold output of Idaho for that year at $2,323,700.

Work on the Crescent mine, at Kendrick, operated by Willis Sweet, is being pushed.

At Florence six 5-stamp mills are crushing, and arrangements are being made for putting mills on properties developed sufficiently to warrant their use.

The Banner has enough ore in sight to run their mill for three years.

The Franklin group of mines at Pine Grove, Idaho, has been sold to the Franklin G. M. Co. of Spokane for $20,000. The property embraces three claims and a mill. L. C. Barton, secretary.

MONTANA.

The Anaconda Co. is shipping 215 cars per day. About 6,000 tons is taken from the mines each twenty-four hours.

The St. Lawrence has closed for repairs. It is the intention of the Anaconda to retimber the shaft from the surface to the 1,000-foot station. This will keep the mine closed till March 10, '98.

W. A. Clark on the 13th sold his Butte property to the Colusa Parrot M. & S. Co. of Spokane for $1,000,000. Mr. Clark and his son, C. W. Clark, are stockholders in the new company. The sale includes four mines and the Butte reduction works. A. J. Johnson and A. H. Wethy of Butte and C. A. McBroom of Spokane are interested in the company.

WYOMING.

Wire gold on the Whippoorwill, at Grand Encampment, has been discovered in rose-colored quartz. The vein is 3 feet wide, in a diorite formation.

COLORADO.

The Modoc dumps sent out ten tons of screenings which from assay tests run as high as 1¼ ounces to the ton. Griswold & Co. are washing rock from the dump, and saving 200 pounds daily of clay that runs as high as $93 to the ton.

Keith & Co. made a shipment from the Homestake. A new shaft has been started and at a depth of 55 feet the vein was encountered.

The Acacia Co., crosscutting at 342 feet depth, found the vein 16 feet wide; finding no pay at the point of intersection, they are drifting for the chute.

Eldora, Boulder county, claims thirteen shipping mines.

Thorpe, Habrell & Co., of the St. Louis, Boulder county, are drifting on a 4-foot vein of sulphide ore, which averages $30 per ton. The main shaft has been sunk 170 feet. Sixteen tons returned $125 per ton in gold. This is in the Caribou silver belt. The ore on the surface was free milling sugar quartz; deeper it showed hematite, and in the lower workings sulphides of iron, with streaks of tellurium quartz.

The Dolly B., at Leadville, P. R. Connolly Supt., is a new producer.

The Lady Alice, in Adlaide Park, has resumed operations.

The Central Aspen S. M. Co. has been wound up and the New Aspen S. M. Co. Ltd., organized and the Badger group deeded to the new company.

The Denver *Republican* says that ore has been coming out of Cripple Creek the first five days of this month at a rate never equaled in the district.

S. Dyer has sold to the Dorcas Co. his Kyle and Gurley claims for $20,000, of which a cash payment of $7000 was made.

About 205 cars of ore were shipped from Ouray during November, and one car from the Bimetallist.

No department of business shows greater increase in economy and improvement of methods than mining. Herewith is a table showing cost of supplies, labor and treatment in 1870, as compared with the present time in Ward district, Boulder county:

Article.	*1870.*	*1897.*
Giant powder, per lb	$ 1 00	$ 12
Steel, per lb	40	08
Rope, per lb	60	15
Iron, per lb	25	03
Giant caps, per 100	3 00	55
Fuse, per 100 feet	3 00	55
Lumber, per 1000 feet	60 00	14 00
Candles, per box	20 00	4 00
Nails, per keg	20 00	3 00
Coal oil, per gallon	3 00	20
Wood, per cord	8 00	3 00
Picks, each	3 75	1 00
Shovels, each	2 75	1 00
Miners, per day	4 00	3 00
Teaming, per day	12 00	4 00
Stamp mill charges, per ton	5 00	2 00
Smelting charges, per ton	60 00	7 00

During all these years gold, the product, remains the same, $20.67 per ounce.

The latest dividend declared by the Portland, payable December 15th, is the twelfth this year, total amount paid stockholders $1,267,080. The total gross production of the Portland Co. for 1896 was $1,116,128.29; net earnings for that year $897,089.48. The dividend expense account for the same year was $360,000.

The Peerless, at Aguilar, has passed into the hands of the Northern Coal Co. Wm. McNeil is Supt.

The Congress, at Ouray, is shipping two cars per day.

Manager DeMasters of the Lucky Gus, at Goldfields, made a shipment of thirty tons of $75 ore.

The tonnage from the Isabella, Cripple Creek, for November, was the largest in the history of the company. A total of 1568 tons was shipped. The net smelter earnings for the month will aggregate fully $80,000, with a mine operating expense for the same period of between $21,000 and $22,000, leaving a net profit for the month of between $8000 and $9000.

Development work on the Golconda, Cripple Creek, is being pushed under the management of Supt. Argersinger.

At Aspen, for handling their low grade ores, the Mollie Gibson and Argentum-Juniata companies contemplate buying the old Holden lixiviation plant. This plant was erected in 1891 by the Holden S. & M. Co., costing $250,000. Since 1893 this plant has lain idle.

The output from the Portland, Cripple Creek, averages 60 tons per day. The big pump at the 800-foot station is raising at the rate of 625 gallons of water per minute. Sinking to the 1000-foot point has commenced.

The Strong has its ore bins full. The daily production is kept down to 100 tons. This ore without sorting is good for $50 per ton. The vein in place at 500 feet is 30 feet wide.

The Independence is sending from 50 to 60 tons per day to the smelters. There is more and better ore blocked out in Mr. Stratton's famous bonanza than at any time in its history.

NEW MEXICO.

The new mills in South Santa Fe county have started up. The new Cerrillos smelter began running Dec. 1st. Many silver-lead mines in the Cerrillos district, idle for years, are now actively worked in anticipation of this fresh demand for their ores.

The McGee M. & M. Co. started its new mill at Dolores.

Reports from Cochiti confirm the sale of the Lone Star group to W. B. McFarland and others of Chicago and the sale of the Albermarle group to O. P. Posey of Los Angeles, Cal.

The Silver City *Enterprise* reports a strike of rich gold ore near Santa Rita. Samples were assayed and gave returns of 80 ounces gold per ton. The vein lies on the southwest slope of Santa Rita mountain, a mile and a half from the Kneeling Nun.

The Crown Point tunnel, Golden Santa Fe county, is in 565 feet. C. Wegan is the manager. The lode has an 80-foot shaft.

J. C. Bender, San Pedro, sold his interest in four claims to Dr. Bailey for $5000. The mine is opened by a shaft 137 feet. One shipment gave a net profit of $28.

The Maggie G. prospect, Santa Fe county, is opening a body of gold-silver-lead ore showing a 3-foot lode.

At Allerton R. W. Woodbury has organized a company to build a 50-ton custom mill, with a capacity for enlarging to 200 tons. J. P. Whitney of Boston, the largest owner of the Cochiti grant, upon which the new mill will be situated, is a member of the company.

Marks & Luthe of Springer closed a deal with A. D. McDonald and S. D. Gardom for an interest in The Gallhale and have put on a crew. They have over 2 feet of pay ore to start on.

The *New Mexican* says the Gusdorf Bros. of Taos, in crosscutting, encountered a streak 14 inches wide that averages $100 per ton in gold. They cut through 7 feet of mineralized quartz. The quartz on either side of the rich pay streak runs from $4 to $25 per ton, and, with suitable milling facilities on the ground, the entire ledge can be treated at a profit.

On the Pinos Altos G. M. Co., Silver City, the Gillette shaft will be sunk without cessation of work until the 1,000-foot level is reached. It has reached 570 feet. At the Hearst shaft drifts are being run at the 500 level. At the Thayer drifts are being run at the 450-foot level. D. B. Gillette is the Mgr.

ARIZONA.

Work on coal properties near Benson is being pushed. P. Jensen owns a group upon which he has drifts and shafts to the extent of 600 feet.

The Old Dominion Copper M. & S. Co. has completed its shaft to a depth of 850 feet.

A large body of iron was recently encountered on the Black Copper, one of the Black Warrior Copper Co.'s group.

The Planet Saturn is putting in a stamp mill. They have a 6-foot ledge that is said to run from $10 to $14 per ton. W. A. Clark is Supt.

Reports from the Gold Cliff, at Pearce, under the superintendency of F. P. Hewett, are encouraging. The force is being increased and the cyanide plant is working constantly. Crushing machinery is being placed and the capacity of the cyanide plant increased.

The chute on the Six Mile Hill, near Tombstone, has been opened up, displaying nearly 6 feet width. Assays show returns of $300 per ton—five-eighths gold.

Five claims are being developed in Walnut Grove district, Yavapai county, by J. McNary and sons.

White Picacho Dist., Yavapai county, numbers several mines, among them one owned by G. Burnell, on which 30 inches of $280 rock is said to have been struck at a depth of 110 ft. The vein was reached by a 75-foot tunnel.

The King of Arizona mine is locally reported sold for $750,000 by Epis Randolph for Eichelberger & Duncan of Yuma. One year ago this mine was unknown.

J. I. Coleman purchased an interest in the Christmas Gift and Good Luck on Salt river. The C. G. ledge is 6½ feet wide and the ore mills from $15 to $20 per ton.

R. W. Groom has sold a half-interest in the Swansea and Jones to the Bessemer Copper M. Co. for $75,000.

According to the local papers, John W. Mackay, G. D. Roberts and J. W. Payne have bought the Grand Reef, 50 miles north of Wilcox, and bids have been let for a pipe line for reduction works. The last payment of $60,000 was made on the 16th inst.

H. J. Allen and E. W. Johnson of Jerome made entry of 320 acres in Bernalillo county, as coal land. They paid the land office $6400, at the rate of $20 per acre. They will commence development work at once and will erect an electric plant for power and lighting. The coal is at Gallup. Allen and Johnson are acting for the Arizona Copper Co. at Jerome. They say that the mines will have good machinery.

A company has been formed to operate the Guadalupe in Yuma county, thirty-five miles east of Ehrenberg. The incorporators are Chicago men. They will put in a large plant. The local office will be at Quartzite.

The report circulated that the Congress Co. contemplates closing down the cyanide plant is without foundation, says Pres. E. B. Gage.

The Gold Wave north of Congress has an owner and a Supt. of the same name, J. H. Costello.

The Anglo-Continental gold syndicate of Great Britain has instituted suit in Denver against Messrs. Bashford and Keating for $50,000 alleged damages. It is averred that the defendants "salted" the Jersey Lily group of mines in Yavapai county, A. T., thereby deceiving Expert Roepell as to their value, and on his favorable report the plaintiffs paid the defendants $25,000 for stock in the Jersey Lily Company and expended $25,000 more in developing the property and ascertaining its true value. The Jersey Lily Company, besides sueing Bashford and Keating for $50,000 damages, asks to have certain contracts entered into with the defendants declared void.

MEXICO.

E. A. Dolan says that "the Yaqui country has enough gold in it to attract a whole lot of people, but the same amount in California wouldn't take people two miles. The greatest amount that I learned of any one making while there was $2 per day, and few doing that. A great many have rushed in and located claims from which they find it difficult to wash out half a dollar a day. Naturally provisions are expensive, and the result of the average day's work won't pay for a man's living. There is some gold there, but it is exceedingly fine and is scattered over a whole lot of territory. The most of the people who are going to the Yaqui country now are either from Arizona or California, where there is ten times as much placer gold easy of access as the Yaqui river sands contain."

The Bonanza in the Sierra Pinta has been sold and first payment made.

Nogales *Vidette*: The Chucubabe, Sonora, has been paid for and a new mill erected. At 80 feet a body of gold ore was struck.

Mr. Menager of the Cerro Prieto has opened an ore body at a depth of 200 feet with a ledge varying from 5 to 12 feet. Assays averaged from $9 to $15 in gold.

Denver people have made final payment on the Chanate, near Altar.

Facts Regarding the Klondike Region.

J. D. McGillivray, of the MINING AND SCIENTIFIC PRESS, who went to the Klondike last July, sends the N. Y. *Herald* an authentic report from a practical mining man actually on the ground. He went under what was probably the highest priced contract in the history of mining correspondence, and by the terms of which he was precluded from furnishing any news for any other paper. This last is stated in answer to the many inquiries, why, among the correspondents from the Klondike for this paper, Mr. McGillivray's name has not appeared. In the issue of the *Herald* of the 8th inst. is a letter from him dated Dawson City, October 17th, which illustrates his practical way of stating the facts and which fully corroborates all that the MINING AND SCIENTIFIC PRESS has hitherto said about that much boomed, widely and wildly advertised region:

Nine out of ten of the numbers who have come to the Yukon in the rush now wish they were back home. They have learned that there are no mines for them, and that wages at $15 a day is a myth. It should be borne in mind by all who think of coming here that with all the prospecting that has been done by hundreds of experienced men during the past ten years only one discovery has been made of ground that will under present conditions pay large profits, and that is on Bonanza and its tributary, Eldorado creek. None who come here now may hope to obtain mines on these creeks, except at exorbitant prices. There have been many stampedes of late, but there have been stampedes for years along the Yukon upon the reports of rich discoveries, and all who have joined in these rushes have been disappointed with the exception of those who came to the Klondike. There has been a rush to Munook creek and locations are selling there for as much as $5000 each. This is all based on the fact that one man found a good prospect at the bottom of a shaft last spring, and the further fact that food is more accessible there than elsewhere. It is possible that Munook will turn out to be another Eldorado, but no more probable than that Coal creek, Mission creek, American, Nation, Henderson or a dozen others will turn out rich. The chances of finding another creek as rich as Eldorado are very small. One may be found—a dozen may. It is possible that another Cripple Creek will be found in Colorado, but that is no reason why all the world should rush to Colorado. There is nothing left for those who are now coming, or are here and waiting for some one to start a stampede, to do but go out prospecting or work for wages. Wages will probably be $1 an hour. If they shall be $1.50 an hour the mine owners will say that they will not employ many men. In winter men can work but seven or eight hours a day. Fifteen dollars a day has seldom been earned at wages except in a few summer claims. The only other alternative is to go out prospecting. To simply live here involves hard work. But to prospect means hardship and privation that none but the most hardy can endure. One must carry his tools, bedding, stove and food on his back over the most wretched roads, or after the winter has set in pay freight at the rate of 10 or 15 cents a pound. In summer freight is from 25 cents to $1 a pound from Dawson or Circle City or Forty Mile out to the creeks. To the prospector this is prohibitive, for to move out to one of the creeks with a small outfit takes a long time. One must build a cabin or sleep in a tent with the thermometer registering at times 70° or 80° below zero. Prospecting itself when on the ground involves much more labor for the results than in any other mining district in the world. It is seldom that the pay dirt is to be found uncovered, and shafts must be sunk to bedrock by thawing the ground with fires and digging out.

The pay channel, as it is called, is generally from 15 to 50 or 60 feet wide. In order to locate it, prospect shafts must be sunk at short distances across the valley of the creek, which may be from 100 to 1000 feet wide. A season may be lost in prospecting in one or two rows of holes. They may be sunk where there is no good pay in the creek, while rich ground may be found later a few hundred yards above or below.

In California in early days prospecting along the creeks was simple and easy. The pay was in or near the creek beds. One could follow up a stream and pan out a little here and there until he came to rich ground. To prospect miles of creeks was the work of a few days. Here it is all different. In the first place, the gold is not in the beds of the present streams nor in such bars as bordered the California creeks, but in the "till" or ground moraines of ancient glaciers left there ages before the streams began to cut their present channels, and a week's hard work is necessary to reach it through the muck and gravel that covers it. A man could prospect miles of creeks in California in those days in a week easier and more thoroughly than he could 100 yards of one of these creeks in a year.

To understand this it must be remembered that the gold of the California streams was probably first crushed and milled from the quartz veins of the Sierras by glaciers; that it was then washed by the ancient rivers with the gravel such as is found and being worked now by drifting at a depth of hundreds of feet in places under lava caps on the divides between the present rivers. Those ancient river channels were later cut into and in part washed away by modern rivers and creeks, and along them the gold has been found in their bottoms and in the bars and benches along their sides and formed by them. From these deposits more than five hundred millions of dollars in gold was taken within ten years after Marshall made his discovery in Sutter's mill race at Coloma. The quartz was crushed and the gold concentrated by the glaciers, further concentrated by the ancient rivers and still further concentrated by the modern streams.

Here it is different. Nature has had only the first of these forces at work—that of the glacier. Practically all the rich gold-bearing deposits of the Klondike district on Eldorado and Bonanza creeks are but the ground moraine of great glaciers of the ice age. In all parts of the Yukon country are to be found alluvial deposits in the shape of bars and benches, which contain gold, it is true, but so far none has been found to compare in richness with the gold-bearing deposits of Eldorado and Bonanza creeks, which have been the cause of this useless influx of thousands from the outside world. The best proof of the fact that there are already here many more persons than can hope ever to obtain claims without going far away is in the figures of the Gold Commissioner as to the number of locations that have been made. The whole length, practically, of every creek within a distance of forty miles, and in some directions more, has been located. These creeks include Eldorado, Bonanza, Hunker and other tributaries of the Klondike river, as far up as All Gold, fifty miles away; Sulphur, Dominion and Quartz, branches of Indian; Henderson, a branch of Stewart, and Bryant, Montana, Deadwood and Adams, branches of the Yukon. Yet all these locations, together with a few in the Forty Mile district, do

(*Continued on page 579.*)

Mechanical Progress.

Mechanical Loader for Wire Ropeways and Tramways.

Herewith is illustrated one of the latest patents of Mr. A. S. Hallidie of San Francisco, California, which is a device for loading the carriers of wire trams and ropeways.

Fig. 1 is a side view of the loader, showing the ore bin, the chute, the pendulum with the loading box at its lower end, and the ore carrier.

Fig. 2 is a front view of the same, showing the pendulum and the loading box swung out from its resting place, having discharged its contents into the carrier.

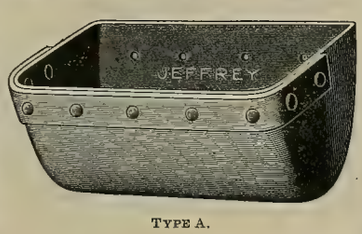
Fig. 3 is an enlarged view of the lower part of Fig. 2, in which the essential parts are shown more in detail.

The apparatus is exceedingly simple and efficient, and with the aid of one man can easily load 300 tons in twelve hours. There is nothing to get out of order and very little to wear out. It is placed in front of the ore bin and receives the ore from the chute, whence it is discharged into a loader box at the foot of the pendulum. The device consists substantially of a pendulum swinging on trunnions about 16 feet above the level of the moving cable. The pendulum is made from No. 16 sheet iron tubing 12 inches in diameter. At the lower end is attached a loading box which contains, when loaded, enough ore to fill one carrier of the ropeway. The loader box has two sides, a back and a sloping bottom. The front of the box is open. With an open front the ore dumped in would, of course, slide out immediately; but while the box is being loaded it is held between a guide and a fixed partition or bulkhead. The loader box containing the ore is thus held in a stationary position by a hooked latch, which forms part of a tripping device consisting of a lever working on a fulcrum, and will be held there until the latch is released from its keeper. The releasing of the loading box is done by the clip on the moving ropeway cable, to which the ore carrier is suspended, and which, as it moves along, strikes the end of the lever and raises the latch. This releases the loading box. At the time the loading box is released the ore carrier is immediately under the nose of the loading box, ready to receive contents. The clip on the moving cable pushes the pendulum along in the direction of the travel of the cable and out from the partition, and thus opens up the front of the loader box and lets the contents pour into the carrier. Both the loader box and ore carrier move together at the same speed for a sufficient distance to allow the ore to be discharged from the loader box into the ore carrier. The swing of the pendulum raises it sufficiently high to clear the rope clip, and the pendulum with its loader box swings back in between the guide and the bulkhead, ready to receive another load of ore from the ore bin.

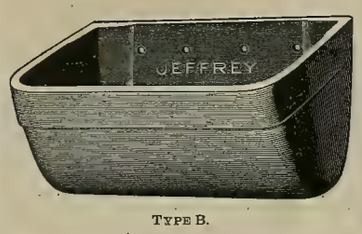
The loader is manufactured by the California Wire Works, whose office is at 330 Market street, San Francisco, California.

Malleable Iron Buckets.

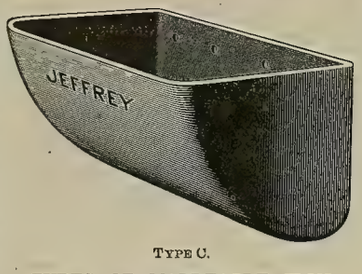
On this page are illustrated several of the various iron buckets manufactured by the Jeffrey Manufacturing Company of Columbus, Ohio, with branch at Denver, Colorado. These types were brought out to meet the special requirements in concentrating and stamping works, and are used in a number of up-to-date plants. Type A shows the standard malleable bucket with renewable steel bands. Type B, special bucket with reinforced heavy front edge and back. Type C, large body bucket. The "A" renewable steel band bucket has found favor in the hands of practical men, for the reason that when the steel band becomes worn it can be replaced. Style "B" bucket is an extra heavy pattern, and in the handling of ores where the water is bad this pattern has been found to wear evenly. Style "C" bucket was specially gotten up for handling water in connection with ores, and is of a shape to insure a large capacity.



TYPE A.



TYPE B.



TYPE C.

TYPES OF MALLEABLE IRON BUCKETS.

These buckets are carried in stock by the Jeffrey Manufacturing Company, who are in position to fill orders promptly. They also manufacture to order buckets of other types, and will quote prices on any special forms.

American Ingenuity.

Recently a French officer of engineers was shown through a large machine shop in Philadelphia, and his attention was called to the great traveling cranes, the enormous planing machines, the big lathes and other large tools; but the visitor appeared to be quite unimpressed and very taciturn. This was attributed partly to the fact that, although he understood what was said to him fairly well, he could speak English only with difficulty. He appeared to be unobservant of the large tools, but was greatly interested in a small, insignificant looking machine used for sharpening the little cutting tools belonging to the big lathes and planing machines. When he had completed his tour of the works and was about to depart he delivered an interesting little speech, of which the following is the substance:

"I have been in America six months, and have visited the mines and manufacturing establishments in the East, West, North and South. I have seen the most gigantic engineering operations and the most powerful machinery in the world; but I shall report to my Government that the biggest things in America are the little things. * * * The French people are experts in domestic economy, and live comfortably by saving what your average families throw away. But Americans are, on the other hand, experts in industrial economy. You make money by saving wastage in business, and you lose some of it by wastage in your domestic economy. The attention paid to small details in your big works is amazing to me; I have visited some establishments where I believe that the profits are made not in the manufacture proper, but in the saving of materials and labor by close attention to details that are with us unconsidered trifles. For example, I saw in your shops just now a little grindstone in operation automatically sharpening lathe and planer tools. This machine costs, probably, as much as a hundred of our ordinary grindstones cost; but I see that it automatically grinds all the tools for 300 high-priced mechanics, and it only works a few hours each day. The skilled mechanics in our country frequently stop their regular work to grind their own tools, and then they do it imperfectly. Your tools are all accurately ground to the best shape by the machines, so that they do more and better work on this account in a given time. I believe that that machine has brains—the brains of the inventor—and it has no doubt revolutionized work of this kind in American machine shops. This is but one case out of many that I have noted."

This visitor was more observant than he appeared to be; for he correctly defined a peculiar characteristic of American inventive genius. The great engineering undertakings, the immense manufacturing establishments and the leviathan machinery are, of course, most conspicuous and impressive; but these big things are comparatively few in number, while the novel improvements in little things—usually classed as "Yankee notions"—are legion, and each one contributes its mite toward the general sum of prosperity of the business of the country.

There is a large tin can manufactory in this city, where cans for holding coal oil are made by automatic machinery. Even the soldering is performed without the aid of human hands. Formerly a small globule of solder collected at each corner of the cans. A "wiper" was devised for removing this drop, and the saving in solder thus effected amounted to a large sum annually. At the great beef-packing establishments not a hair nor a hoof nor a drop of blood is wasted, and Mr. Armour has stated that his fortune was made not in the profits on the sale of meat, but in the saving of parts of the animals that are always thrown away by the ordinary country butcher.

Scientific Progress.

Working Cost of Some Witwatersrand (S. A.) Mines in 1897.

Fischer Wilkinson furnishes the following table showing the working costs of some Witwatersrand mines in 1897:

Stamps.	Cost per Ton.* s. d.	Value of Yield. s. d.	Profit per Ton. s. d.
30	22 5	33 1	10 8
40	21 5	38 5	17 0
40	32 8	40 1	7 5
50	33 11	71 6	38 7
60	23 1	27 3	4 2
70	22 6	45 4	22 10
100	23 3	38 8	15 5
120	19 2	38 4	19 2

*Cost of working per ton milled, including mining, milling, development, cyaniding and general charges, but exclusive of depreciation of plant.

He says: How long the mines will last, whether the large population supported by them will be transient or permanent, are important questions, the answer to which must have a direct influence on the legislation of the Government, on the scale of construction of public works, on the in-

vestment of private capital. For the purpose of showing the great possibilities of these gold fields, I have taken into calculation the twenty-seven and one-half miles of reef which I have analyzed above. The data assumed are:

1.—Depth of mining, 5000 feet vertical.

2.—Length of reef on dip, 10,000 feet, on a basis of the Bezuidenville and Rand Victoria's borehole sections.

3.—One ton—12 cubic feet.

4.—Average thickness of reef milled, allowing for waste, 4 feet. This figure is probably the most liable to error, as the thickness that it will pay to mine depends on that uncertain quantity, the cost of working.

The following shows the valuation of the section of main reef, New Blue Sky to Banket, to 5000 feet vertical: Section A—Crown Reef-Wemmer; B—Henry Nourse-New Heriot; C—Banket-Durban Roodepoort; D—Salisbury-George Goch; E—Paarl-Langlaagte Estate; F—Jumpers-New Blue Sky; G—Kimberley Roodepoort-United Langlaagte.

	1	2	3	4	5	6
	FEET.	Million tons.....	Shillings.....	Million £.....	Million £.....	Million £.....
A	11,200	37	70	129	83	92
B	8,200	27	55	74	40	47
C	12,500	42	45	94	42	52
D, E, F	72,550	242	35	423	121	181
G	41,300	138	25	172	.....	34
	145,750	486	36.8	892	286	406

1. Approximate outcrop distance in feet.
2. Million tons to 5000 vertical feet.
3. Estimated value per ton, in shillings (yield).
4. Gross value in million pounds sterling.
5. Profits with working cost at 25s per ton in millions of pounds.
6. Profits with working cost at 20s per ton in millions of pounds.

It may be useful for reference if I give similar estimates which have been made from time to time:

	Year.	Greatest Vertical Depth in Feet.	Million Pounds.	Miles Outcrop.
Hamilton Smith.	1893	3000-3500	325	11¼
Schmeisser	1893	3900	350	11¼
Hatch & Chalmers.	1895	5000	592	27
Becker	1896	5000	700	20
Hays Hammond	1895	5000	9	...*

* Per one mile outcrop 1000 feet depth.

SAN FRANCISCO has just put in successful operation a garbage crematory, in which is incinerated the garbage and daily refuse of the city. The garbage of a great city is worth a fortune every year, if properly utilized. It is placed in vertical cylinders, surrounded by steam jackets, which evaporate the 75 to 80 per cent of water in the garbage. The fatty substances are dissolved, and, as a result of a number of processes, a fertilizer is produced worth from $9 to $12 per ton. One of the purest and best soaps of the country was made of garbage grease before cotton seed oil entered the field. It is now proposed to light London by electricity for nothing. It now costs that city $1.12 (4s. 8d.) to get rid of a ton of garbage. A combination of boilers and other apparatus has been devised that can burn the garbage at 24 cents (1s.) per ton, and generate steam sufficient to run dynamos to light the entire city. London can thus save 3s. 8d. on each ton, and, in addition, illuminate the city without cost. Garbage, by a machine called the "dust destructor," is converted into clinkers, which can be used for roadways, as artificial stone for sidewalks, and as sand for mortar and cement. In Paris the invisible particles of iron worn from the shoes of horses are rescued by passing powerful magnets through the sweepings.

Origin of Petroleum.

The current number of the *Zeitschrift fur anorganische Chemie* contains a review of the recent work on the genesis of petroleum and other natural hydrocarbons. Engler's hypothesis is that petroleum is formed by the distillation of animal fats at high pressure. Lobry du Bruyn has described a demonstration of this method of formation as a simple laboratory experiment. Heusler calls attention to the fact that Engler's distillate contains a considerable quantity of unsaturated hydrocarbons, which is not the case with petroleum. By treatment with aluminum chloride these hydrocarbons are changed into a high-boiling lubricating oil; hence it is probable that petroleum formation took place in two stages, the first distillate being changed by metallic chlorides into petroleum. According to Ochsenius, petroleum was formed from plant and animal remains by heat and pressure under the influence of the salts derived from sea water. On the other hand, Moissan finds in his work on the metallic carbides, a confirmation of the theory first proposed by Mendeleef—that petroleum originates from the action of water on metallic carbides in the interior of the earth. Uranium carbide, for example, yields with water both solid and liquid hydrocarbons. These are, indeed, in part unsaturated, but at a higher temperature saturated hydrocarbons might be formed from them by the action of hydrogen, which is often evolved from carbides by water. Aluminum carbide and glucinum carbide give with water pure methane (marsh gas). D. Holde claims that the theory that petroleum has originated from animal remains should be known as the Engler-Hofer theory, Hofer having first proposed the theory in 1888 in his "Das Erdol und seine Verwandte," and Engler having by his experiments shown that petroleum can be thus formed. Moissan, in the *Comptes Rendus*, states it as his opinion that, according to its geological relations, the formation of petroleum is to be ascribed to three different causes: (1) The decomposition of organic substances under the influence of pressure and heat; (2) the purely inorganic reaction between water and the metallic carbides; (3) volcanic processes. In many localities it is possible that all three of these factors may have contributed to the formation of petroleum.

THE correct altitude of Mt. Rainier, Wash., is 14,519 feet above sea level.

Electrical Progress.

Great Fall Not Always Necessary.

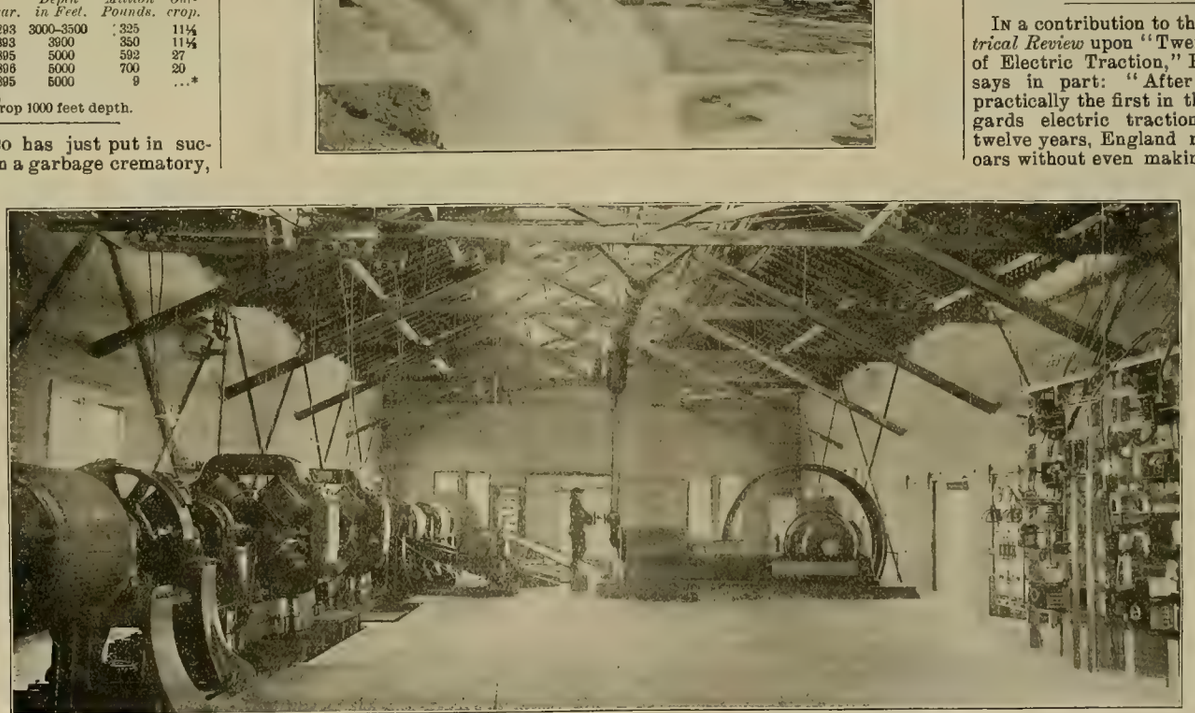
California is pre-eminently the region for success in long distance electrical transmission of power. The water flowing from the Sierras and Coast

borough river, Florida, by the Consumers' Electric Light and Street Railway Company of Tampa, which shows what can be done by good engineering and business sagacity in a level country where natural water power is wanting. This is not only a water power but also a steam power plant. The owners decided not to dispose of the steam plant, but install it in connection with the turbine plant, to be used when water is low and in any other contingency. The station is located six miles above Tampa. The weir dam, shown in the smaller illustration, is constructed of solid masonry. The flumes occupy a space 110 feet long, 24 feet wide and 30 feet high from the base, the weir, 19½ feet high, being joined to the flumes.

Two pairs of horizontal water wheels are installed in the flumes. Two pairs are used for operating the dynamos furnishing power for the street railway and two drive the dynamos furnishing light and power for general use. Each set of turbines is belted to a jackshaft in the power station, 35 feet from the turbine shafting. Clutch pulleys couple the dynamos to the jackshaft on either end, two 30 K.W. alternators for lighting and power to one shaft and two 200 K. W. generators for railway current to the other. The four pairs of wheels develop 1500 H. P. Eight miles is the longest transmission.

CONSIDERABLE progress is being made in Central and South America, with water power for the generation of electricity. Coal is scare and dear, but water is cheap and plenty. In Mexico the Pueblo Lighting Company transmits 965-horse power nine miles into the city; at Pachuca 3300-horse power is sent sixteen miles; the San Rafael Paper Mills have 750-horse power; the Mazipal Copper Company of Conception del Oro has a 400-horse power plant; an 800-horse power plant is to convey power eight miles for the Jalapa Light Company, and San Miguel and Chihuahua are supplied in like manner. In Argentina 5000-horse power is conveyed sixteen miles to Cordova; at Lima, Peru, 150-horse power is sent five miles; and Escuintla (Guatemala), San Salvador (Salvador), San Christobal (Venezuela), and San Gil (Colombia), are all supplied with electricity by water power.

IN a contribution to the London *Electrical Review* upon "Twenty-five Years of Electric Traction," Philip Dawson says in part: "After having been practically the first in the field, as regards electric traction, for nearly twelve years, England rested on her oars without even making an attempt to find out what was being done in America and on the Continent of Europe, or to profit by the experience of others. The American manufacturers soon realized the fact that England would shortly be a fine field, and they therefore took every conceivable trouble to educate tramway companies, engineers and corporations, and with



NEW WATER POWER ELECTRIC STATION NEAR TAMPA, FLORIDA.

such success that now, when at last we have overcome the bugbear of esthetic objections, and when nearly all tramway companies and corporations are going in at once for electricity for their whole systems, there is not one English manufacturer who is able to compete in price or quality with American made goods. No corporation or tramway company can possibly afford to put in experimental work, or to allow contractors who have not done good work before to gain their experience at the expense of tramway owners, or those who are going to work the line and wish to make it a financial success."

AN Italian scientist, Francesco de Vita, has succeeded in making an electric glow lamp in which the filament consists of a very thin platinum wire coated with a layer of some incandescent compound, the nature of which is not yet made known. The filament works well in air, but best in a closed bulb containing dry air. If the bulb contain air the light is a pure white; if it contain other gases the light assumes different colors according to the gas employed. Instead of 2½ to 3½ or 4 watts per candle per hour it is said this lamp used, during an uninterrupted experiment of 480 hours, from 0.41 at first to 0.435 at the end of the experiment; and at the end of this period no change in the filament could be discovered by the microscope.

HIRAM S. MAXIM says of his new electric lamp that he has been attempting to produce a lamp in which a very high resistance might be obtained with a short and thick filament; also to produce a filament which will stand a higher temperature than those ordinarily used, as it is well known that a slight rise in the temperature greatly augments the light given in proportion to the current used. The preparation, however, of the carbon and other materials which form the filament requires a very expensive apparatus, but the cost of the finished filament—excepting first cost of plant—is no greater than with the ordinary lamps.

THE value of the exports of electrical apparatus from this country has amounted in a little more than half a year to over $2,000,000, which represents a gain of about $500,000 over the corresponding period last year. Noteworthy as this improvement has been, it is likely to be small in comparison with the increase which will be seen before another year has elapsed, as the demand for American electrical supplies is apparently growing stronger than ever. And since most of the exports are patented articles, it is fairly sure that the business, whatever measure of growth it may attain, will be a permanent one.

PRACTICAL electricians are inclined to doubt the commercial value of the wireless telegraphic experiments of Marconi and Tesla. What possibilities may develop themselves in this field can only be left to conjecture and the unfolding of the future, but it seems reasonable to predict that the systems recently and widely discussed will be found to have more interest than utility. In a system of telegraphy, speed, simplicity and solidity of the apparatus employed must be united with secrecy and certainty. These requisites are indispensable for either civil or military uses.

SILICON CARBIDE has found a new use. Mixed with about nine times its weight of pure carbon, it is made up into carbons for the electric arc. It resists oxidation better than any substance known, and when hot it gives out a very bright light. It could not be used alone for the purpose, for by itself it is a non-conductor of electricity; but mixed with carbon it is said to serve exceedingly well.

THE Yuba City, Cal., Board of Supervisors have granted to John Martin a franchise to erect poles and wires throughout the county, to conduct electricity for lighting and power purposes. The power is to be generated at the plant on the Yuba river.

The Golden Jubilee Mining Fair.

E. H. Benjamin, Mgr. Mining Dept. Golden Jubilee Mining Fair which opens in San Francisco Jan. 29, 1898, in an interview last Thursday said:

The Miners' Fair, which will open upon the close of the Golden Jubilee at the Mechanics' Pavilion, will be one of the most interesting and instructive exhibits that has ever been shown in this State. If the plans in contemplation by the committee at the present time are carried out, and I have no doubt they will be, there will be practical illustrations of hydraulic, drift gravel and quartz mining. Several quartz mills will be in operation; compressed air drills and compressed air machinery, as well as electrical appliances, will all be shown in detail.

There will be a spectacular exhibit of hydraulic mining that will convey an accurate idea of this great industry that is at the present time laboring under difficulties in California. It will show a section of the great North Bloomfield mine in Nevada county, with two large giants in operation, and also will show a hydraulic elevator in operation on a large scale. Sluice boxes and undercurrents will be introduced to show the methods of saving gold in this class of mining. Nearly all of the prominent mining machinery men in San Francisco will have working exhibits in place. As far as the counties are concerned, but little information is at hand regarding their intention, but I have no doubt that liberal displays will be made of ore and mining appliances. Calaveras county will be ably represented, as will also be El Dorado, Butte and Nevada counties. It is the intention of the committee to make this fair a great instruction as to our methods of mining, and to give the public some faint idea of the magnitude of our mining region and the facilities it will afford to miners or prospectors who will engage in mining in a legitimate way.

Recent California Mining Incorporations.

Gold Home M. Co., San Francisco; capital stock $500,000, subscribed $25; A. S. Tuchler, J. C. Stinson, J. B. Stetson, L. T. Haskell, M. J. Waldheimer.

Mars G. & S. M. Co., San Francisco; capital stock $500,000, subscribed $257,495; A. J. Bailey, W. M. Sullivan, A. L. Emery, W. T. Shurtleff, T. H. Lawler.

Gold Hill M. & M. Co., Riverside; capital stock $300,000, all subscribed; M. W. Clay, D. T. Jackson, I. A. Witherspoon, E. H. Grunwell, I. S. Logan.

Pinami M. Co., Los Angeles; capital stock $200,000, subscribed $6000; A. B. Dresser, M. Zernetti, E. E. Lefebore, W. Declez, D. P. Stone.

Yaqui E. & M. Co., San Francisco; capital stock $100,000, subscribed $25; J. H. Culver, G. Holz, B. Wentworth, C. D. Rogers, B. F. Hook.

Jupiter Con. Gravel M. Co., Auburn; capital stock $100,000, subscribed $25; R. F. Rooney, C. A. Wikman, W. S. Graham, T. J. Nichols, B. B. Dening.

Mayflower M. Co., San Francisco; capital stock, $1,000,000; subscribed, $250; C. A. Malm, W. E. Shepman, J. B. Duggan, J. Zederman, A. H. Winn.

Recently Declared Mining Dividends.

Bunker Hill and Sullivan M. Co., Idaho, 5 cents per share, $15,000; Dec. 4th.

Holy Terror M. Co., South Dakota, 3 cents per share, $9000; Dec. 9th.

Utah M. Co., Utah, 1 cent per share, $1000; Dec. 23d.

Mercur, Utah, 18 cents per share, $36,000; payable Dec. 20.

South Swansea, Utah, 5 cents per share, $7500; payable Dec. 21.

Chloride Point, Utah, 1 per cent, $5000; payable Dec. 24.

Champion, Nevada Co., Cal., 44th dividend, 25 cents, $8500; payable Dec. 21st.

The El Paso G. M. Co., Colo., 1 cent per share; payable Dec. 10th; total amount thus disbursed, $5,402.50.

Elkton Con., Colo., 2 cents per share; payable Dec. 20.

Reco, Slocan, B. C., $100,000; Jan. 1st. This is the Reco's second dividend within a year, making a total of $287,500.

Idaho, Slocan, B. C., $30,000; payable immediately. Total to date, $240,000.

Coast Industrial Notes.

—Engineer Storey says that the Valley road will reach the Kern river by Jan. 1, '98.

—The Mexican Minister of Finance has been authorized to issue a new series of 5% silver bonds of the interior debt to the amount of $20,000,000, making the total authorization $60,000,000.

—At the meeting of the California State Fruit Growers' Convention, held in Sacramento last month, a committee of fifty was appointed to solicit subscriptions to a fund of $10,000 to advertise California fruit products in European markets.

—To avoid the necessity of maintaining a ferry across the Columbia river at Kalama, Wash., the N. P. R. Co. will build up the north side of the Columbia from Kalama to Vancouver, cross the river by a bridge at the latter place and enter Portland over the O. R. & N. Co.'s track.

—Sulphur deposits owned by the Mexican Sulphur Company on the Colorado river below Yuma, Arizona, are to be developed, and a railroad is to be constructed from the mines to the Colorado river. According to the Yuma *Sun*, as soon as the shipment of sulphur in large quantities begins the company will charter ocean steamers and ship by the gulf route.

—The amount of mortgages canceled in fourteen counties of Oregon the past year is as follows: Marion, $546,763; Linn, $489,000; Umatilla, $450,000; Washington, $240,000; Union, $235,405; Lane, $201,540; Douglas, $137,680; Benton, $79,528; Jackson, $73,857; Crook, $65,477; Malheur, $61,044; Wallowa, $25,600; Morrow, $12,446; Clatsop, $10,000; total, $2,628,342.

—An agreement has been signed by President Asana of the Japanese Steamship Company, Toyo Kaisha, and S. P. Schwerin, representing the Pacific Mail and the Occidental and Oriental Companies. An agreement has been entered into by the steamship lines named whereby the steamers of the Toyo Kisson Kaisha Line will be put on between Yokohama and San Francisco early in 1898. President Asana was in San Francisco not long ago in the interest of his company. When he returned to Japan there was considerable doubt as to whether he would have his steamships touch the port of San Francisco. This sets the matter at rest and insures for this city a more frequent service between San Francisco and the Orient.

—Relative to the report that machinery would be admitted into Russia free of duty after January 1, 1898, it is to be said that there will be no change in the existing rates. The duty is 2 roubles 10 kopecks per poud. The Russian poud is 36 pounds. A rouble is 50 cents of our money, and there are 100 kopecks in the rouble. The duty is equivalent to $1.05 for 36 pounds, or nearly 3 cents per pound. Our manufacturers might infer from this that they could not get into that market. This is not the case, as large amounts of American and German machinery are now going into Russia. It would pay our manufacturers in all lines to investigate that market, as there is a great development now in progress, and for the future in Russia. The high duties enable the few manufacturers there to ask enormous prices, and get them.

—A gentleman who has recently made some minute inquiries into the life of the coolie classes of Japan has furnished to the *Osaka Mainichi* the results of his investigations of the earnings and expenses of 100 laborers and their families. He finds that the average daily expenses per family amount to 46 8 sen (about 23 cents), made up as follows: House rent, 5.5 sen; rice, 24.5; other food, 5.5; firewood and charcoal, 2.7; clothes and utensils, 2.6; bath, 2.0; sundry expenses, 4.0; total daily expenses, 46.8 sen. The average earnings of the head of a family are 10.50 yen ($5.25) per month, or 35 sen (17½ cents) per day. This would show that the family expenses exceed the earnings of the man by 11.8 sen per day; but this investigator found that other members of the family earn an average of 18.8 sen per day, giving a total of nearly 54 sen per day. This leaves a margin of about 7 sen, or 3½ cents, per day to cover any other expenses.

—The Southern Pacific Company has advanced its freight tariff on some west-bound commodities. The new rates to California terminal points on some items, as compared with the prevailing rates, are as follows:

COMMODITIES.	*From New York by Sunset Gulf Line, and from Chicago*		*From New York by the All-Rail Route*	
	New Rate.	*Old Rate.*	*New Rate.*	*Old Rate.*
Cast and wrought iron pipe.	66	50	75	50
Brass goods, including butts, bolts and castings	85	75	85	75
Roofing composition	75	65	85	75
Iron, including boiler and plate iron, butts and hinges	66	60	75	75
Iron rivets	66	50	75	75
Bailing ties	66	50	75	75
Quicksilver flasks	66	60	75	75
Nails and spikes	66	50	75	75
Barbed and fence wire	66	50	75	75

The rates quoted are in cents per 100 pound on carload lots only.

—The Peruvian Government has decided to establish a permanent exposition for all classes of manufactured articles in the lines of machinery, giving preference to such as are mostly used in Peru, viz., agricultural implements, mining machinery, electrical appliances of every description, and apparatus for labor-saving machinery. This is done as a means to increase trade in the machinery and kindred lines with manufacturing countries. The Peruvian Government has never before given such inducements to foster trade, and the facilities offered to American manufacturers are advantageous. The exposition was opened on the 9th inst., at Lima. All exhibits are exempt from custom house duties as well as from consular fees. Exhibitors will have the option to show their wares for a period of six months; should longer time be required, arrangements may be made by applying to the officials in charge. The Bureau reports the recent discovery of gold fields in the eastern part of Peru, which are richer than any hitherto found in that country, already noted for its wealth in precious metals. The Departments of Cuzco and Puno, in which are located the fields, are reached by railroad from the Pacific port of Mollendo. A railroad is already in operation from that point to the Department of Puno. At present the journey from Puno to Cuzco is made on muleback, but it is stated a projected line will shortly complete the railroad connection.

—Professor Frank Soule of the civil engineering department of the Berkeley, Cal., University has completed a series of tests undertaken to ascertain the strength of California marble. He found that the product of this State compares very favorably with the best in the country. The strongest found in California was from Mount Slover, San Bernardino county. A 3-inch cube of marble sent by George A. Moore from quarries near Colton, San Bernardino county, was placed between the steel pistons of a rock-testing machine and subjected to a pressure of 118,800 pounds, at which point it crumbled. This shows that the marble can resist a pressure of 13,200 pounds to the square inch. A second cube of Colton marble crumbled at 9350 pounds pressure to the square inch. The most remarkable marble tested was a cube of white dolomite from the Inyo quarries, from which it is proposed to build the San Francisco postoffice. The rock did not crumble until a pressure of 30,500 pounds to the square inch was exerted. Scarcely anywhere else in the world is marble of such strength to be found. Its great density makes it proof against fire, frost and water. "The University of California is anxious to assist new industries," said Prof. Soule. "Any one who contemplates opening a new quarry can have the rock tested free of charge if he will send six dressed cubes of the rock, three inches on the edge, to my care, freight charges prepaid. The university asks a fee sufficient to cover expenses if the enterprise is already commercially established. We are now experimenting on the strength of rocks, piles, structural iron and other building materials."

Personal.

D. B. GILLETTE is in Santa Rita, New Mexico.

E. BIND, Placerville, Cal., is in San Francisco.

H. A. KELLER has returned from Butte, Montana.

J. M. THOMAS is Supt. of the Oak group, Mercur, Utah.

J. P. TURNER is Supt. of the Last Chance, Bingham, Utah.

J. K. HARRISON is Supt. of the British Columbia, at Grand Forks, B. C.

CAPT. G. H. NIHELL, from Nevada City, Cal., is visiting San Francisco.

A. TRITTENBACH, Supt. Dutch mine, Tuolumne Co., Cal., is in San Francisco.

H. E. ARMITAGE has resigned as Supt. of the Sun Dance, in Yavapai Co., Arizona.

T. GEDDES, Mgr. of the Swansea at Tintic, Utah, has returned from Denver.

W. F. ENGLEBRIGHT, M. E., of Nevada City, Cal., was in San Francisco this week.

H. E. WINSLOW is Supt. of the Colorado and Idaho M. & M. Co., at Centerville, Idaho.

ALEX MCCLURG is the Mgr. for the new company of the Flourine, Cripple Creek, Colo.

E. V. ZUMBIEL succeeds Mr. Zeek as Supt. of the Red Hill M. & M. Co., Jackson, Cal.

H. L. CURTIS succeeds Dr. Woodruff as Mgr. of the Northern Light, Mercur, Utah.

R. V. HOLTON, Supt. of the Ormonde, Washington, Nevada Co., Cal., is in San Francisco.

J. S. GOODWIN of You Bet, Cal., made his annual visit to San Francisco during the week.

MGR. T. F. BRUBACK of the Bingham, Utah, Placer M. Co., returns from London next week.

OTTO STAHLMEYER is superintending trial operations at Golconda, Nev., for the Glasgow M. Co.

A. B. BELL of Nevada City, Cal., has taken charge of the Ray mine, near Grants Pass, Oregon.

L. REEL has been appointed Supt. Bloss & McCleary hydraulic mine, at Trinity Center, Cal.

E. W. CHAPMAN, El Dorado, and I. N. Chapman, Oakland, were in Tuolumne Co., Cal., last week.

G. W. STARR is expected to arrive at his home in Grass Valley, Cal., from South Africa next month.

CY MULKEY, Mgr. of the Mulkey & Spreckels mine, El Dorado Co., Cal., left this week for the mine.

W. J. ELMENDORF of Denver is the new superintendent of the Geyser mine, Silver Cliff, Colo.

J. H. MARCOM, superintendent the Colorado Iron Works, has returned from Salt Lake City to Denver.

ALEX MCDONALD of Oakland is slated for

the superintendency of the Zantgraf, in El Dorado Co., Cal.

MR. COLEMAN of California succeeds L. Lindsay as Supt. of the Santa Rosalia, Nogales, Arizona.

SYDNEY SMITH of San Francisco is in Nevada City, Cal., to start work on his Bismarck and Gladstone lodes.

W. J. NELSON succeeds O. B. Hardy as superintendent of the Boston-Nevada smelter at Mason Valley, Nev.

H. E. PICKET, manager and part owner Grand Victory, Placerville, Cal., has again assumed personal charge.

CHAS. BUTTERS is about to return from South Africa and is expected in San Francisco shortly after the first of the year.

L. MOORE of Cincinnati, Ohio, Pres. of the Pend d'Oreille G. M. & M. Co., is on his annual visit to Spokane, Wash.

J. R. NUTTALL, Pres. of the W. Y. O. D., at Grass Valley, Cal., returned to San Francisco from the mine last Tuesday.

CECIL C. MORGAN is on his way to Europe to consult with his company concerning the turquoise mines in New Mexico.

GEO. W. DICKIE of the Union Iron Works has been elected vice-president of the American Society of Mechanical Engineers.

J. PARKER WHITNEY of Boston, Pres. of the Santa Rita Copper and Iron Co., New Mexico, has arrived in San Francisco.

GEO. MAINHART, Supt. Omaha Con., Grass Valley, Cal., attended a meeting of his company in San Francisco last Monday.

E. H. AIRIS of the Mercur, Geyser-Marion and Northern Light, bought a one-sixth interest in the Snowstorm, Mercur, Utah.

H. WILSON, Mgr. of the Silverton, Colo., smelter, has gone to Tasmania, where he will direct the construction of a pyritic smelter.

GEO. MAYNARD, who was here with J. W. Mackay and party, has returned to New York. A property near Wilcox, Arizona, was bought.

W. K. MEADE, outgoing U. S. Marshal of Arizona, left San Francisco last Wednesday with four California miners for Stewart river, Alaska.

W. C. HUNTON, who has been superintending mining properties in the Province of San Juan, Argentine Republic, has returned to California in ill health..

HAMILTON SMITH is now credited with intention to traverse the Klondike with powers plenipotentiary from "a British-American purchasing syndicate."

E. H. BENJAMIN of Oakland has been appointed Superintendent of Mining Exhibits at the Golden Jubilee Mining Fair, and L. W. Buckley, Manager of Special Exhibits, as assistant to General Superintendent Gilmour.

AUGUSTUS J. BOWIE of San Francisco left here July 28th, 1897, en route for the Klondike. Mr. Bowie is credited with being paid a fee of $25,000 by James R. Keene and others of New York City to expert and report on that region. Mr. Bowie writes from Dawson City, under date of October 3rd, describing the raid on the steamer Bella at Circle City on September 25th, when she was boarded and taken possession of by fifty armed men, who demanded all her stores and supplies for the starving people at Circle City, about 188 miners. There were thirty passengers on board, including Captain Ray, U. S. A., who addressed the men, but without success. They took thirty tons of provisions. Mr. Bowie says when the steamer arrived at Fort Cudahy "rumors came thick and fast about starvation in Dawson City and the terrible condition of affairs throughout the country. The ice was forming rapidly in the Yukon, and it looked as though the steamer would be unable to face the floating masses as they came down the stream. September 30th, although partially frozen in, the steamer started for Dawson City, fifty-three miles away, where she arrived at half-past 5 o'clock that evening. A more God-forsaken place you never saw. The town lies on a flat on the east side of the river, immediately back of which are hills about 500 feet high. The river is about three-eighths of a mile wide, and is, I should judge, quite deep. The elevation above sea level is approximately 1000 feet. Where the town is located must have been an old moose swamp. During the summer time it is undoubtedly a regular quagmire. There are fully 500 loafers in town, who won't work and expect to be fed, and there is no food to feed them with. The police won't arrest them, because they haven't any food with which to feed them. Everything is frozen except the whisky, and there seems to be an unlimited supply of that article at 50 cents a drink, or $10 per bottle. Champagne is $36 per bottle, and I suppose other beverages are at corresponding figures. Five-cent cigars cost 50 cents each, and flour, outside of the company's contracts, $125 for a fifty-pound sack; candles, $1 apiece. Seventy-five dollars is paid for a five-gallon can of coal oil. In fact, none is for sale. Sugar is 30 cents and tea $1 a pound; coffee, $1 a pound, and not fit for dogs. Ordinary dog meat, which means dried fish, $1 a pound. No man works for less than $15 for nine hours, and confers a very great favor upon you even at that rate. Cordwood, sawed and split, is $50 a cord in the yard. Can't say what it will be before this winter is over. Cooking stoves are not to be had for love or money. Some sheet iron ones can be obtained at a cost ranging from $75 to $100. There is one tinner in town working five men, and his orders are thirty days ahead. Sawed lumber of the poorest quality sells, when you can get it, for $160 for 1000 feet, and flooring is 20 cents a foot. The restaurants are all closed because they cannot buy supplies; bakeries closed because there is no flour to be obtained. There is no hotel and there are no lodging houses. What in the world these people are going to do before the season is over I cannot say. Every building on the main street is either a saloon with a gambling outfit or a dance house. There are only two stores, which belong to the companies, respectively, the Alaska Commercial Company and the North American Transportation and Trading Company. They close at 5 o'clock, because they have no candles or oil to burn. There is absolutely no place to go. There will be no more steamers here until next July. The people are still coming over the trail without provisions. The police here are driving every one down the river as he arrives, and the companies will assist in pushing out of town all persons who are not supplied with food. To lose our supplies at this stage of affairs in Dawson would simply mean death. Money can't buy food, and the actual staple of life, flour, is unobtainable." At the date of writing Mr. Bowie contemplated return at the earliest opportunity.

Commercial Paragraphs.

THE Paraffine Paint Co., 116 Battery street, San Francisco, has declared dividend No. 26, of 25 cents per share, payable at its office Dec. 23.

THE Gold Dredging machinery made by the Risdon Iron Works, San Francisco, suitable for the Klondike region, supplies its own propelling power, an additional element of value to miners.

C. B. BOOTHE & Co. of Los Angeles have sold a pumping plant to the State of Arizona Improvement Co., Yuma, Arizona, with a capacity of 25,000 gallons per minute, for irrigating purposes. It is being installed under the supervision of Edward B. Ives. The Kingman, Arizona, Mining and Milling Co. have placed an order with C. B. Boothe & Co. for one of their new air compressor plants and two special air drills. The California Construction Co., operating in the San Gabriel canyon, have recently purchased of the same firm one of their new style air compressors and three special air drills.

P. W. MOEN, of the Washburn & Moen Manufacturing Co., Worcester, Mass., which firm is to be a member of the new $50,000,000 wire combine, says that no scheme looking to a trust has been under consideration; that the purpose of the combine is economy in administration and cheapening of the cost of manufacture, and with that end in view a number of the larger manufacturers are proposing to form a new corporation under the auspices of J. P. Morgan & Co., to purchase and take over as going concerns a number of establishments that are engaged in mining ores and coal and in manufacturing steel and wire products. In the case of Washburn & Moen Co, J. P. Morgan & Co. will purchase the capital stock of the corporation at a price which properly represents the value of the business conducted. The combination will probably not be completed before March 1st, '98. Among the Eastern members of the combine will be: The American Electrical Works at Phillipsdale, R. I.; Ansonia Wire & Brass Co., Ansonia, Conn.; Bridgeport Brass Co., Bridgeport, Conn.; Benedict & Burnham Manufacturing Co., Waterbury, Conn.; Coe Brass Manufacturing Co., Ansonia and Torrington, Conn.; Holmes, Booth & Hayden, Waterbury, Conn.; Taunton Copper Manufacturing Co., Taunton, Mass.; Seymour Manufacturing Co., Seymour, Conn., and Washburn & Moen, Worcester, Mass.

THE factory of the Westinghouse Electric & Mfg. Co. at East Pittsburg, Penn., is at the present time very busy on a number of electric machines, all intended for Niagara Falls and other companies in the vicinity of the great electric power center. It will be remembered about six months ago the Cataract Construction Co. contracted with the Westinghouse people for an enormous addition to the power station, consisting of five 5000 H. P. generators, of the same pattern as the three already installed. In addition to these five machines, which are now under way (in fact shipment has already commenced) the factory is also building exciters representing a capacity of 675 H. P. The generators are also being made now and all of these machines will be applied to the Niagara power house as soon as required. The Niagara Falls Hydraulic Power & Mfg. Co. some time ago contracted with the Westinghouse Electric & Mfg. Co. for six 750 H. P. direct current generators, 300 volts, 250 R. P. M. These generators will be direct connected to Leffel turbines and they will be used for generating current that will be supplied to the aluminum factory of the Pittsburg Reduction Co. at Niagara. The Westinghouse Electric Co. has also constructed two 300 H. P. two-phase induction motors, contracted for by the Buffalo Niagara Falls Electric Light & Power Co. These motors will be used for driving alternating current generators, direct current generators, arc machines, etc. The Niagara Electro-Chemical Co. has contracted for a large increase in its transformer station, located above the power house of the Niagara Falls Power Co., consisting of three 235 H. P. two-phase rotary transformers and one 175 H. P. rotary transformer supplying current for the reduction of metallic sodium from caustic soda. In addition to these transformers the Westinghouse Electric & Mfg. Co. are also making for the same company 800 H. P. in air cooled oil converters, consisting of six 133 H. P. converters, 3000 alternations, which will supply current for rotaries. The Acetylene Light & Power Co. has contracted for two 1000 H. P. oil converters, water cooled, of 3000 alternations, primary 2200 volts, secondary 100 volts. These converters will supply current for arc furnaces for the manufacture of calcium carbide. The Mathieson Alkali Co. contracted with the Westinghouse Electric & Mfg. Co. some time ago for a number of rotary transformers, induction motors, and oil converters, which were recently installed and consist of eleven 165 H. P. rotary transformers, several small induction motors, twenty-two 82½ H. P. oil converters, four 33⅓ H. P. oil converters and two 13⅓ H. P. oil converters. These facts are the best evidence of the growing acivity manifesting itself in the use of electrical apparatus at Niagara Falls, all of which has been occasioned by the erection of the large power station of the Cataract Construction Co., the generators for which were installed by the Westinghouse Electric & Mfg. Co.

Facts Regarding the Klondike Region.

(*Continued from page 575.*)

not exceed in number 1881. But under the mining laws a man may locate one claim in each division of the Yukon district. There are eight divisions, and many men have claims in several of these. So it is safe to say that about 1000 men own all these claims. There are in Dawson and in the mines of these districts at the present time over four thousand five hundred persons, and probably five thousand. Besides this there are, of those who came in late by St. Michael and those who went down to Fort Yukon in order to obtain food, certainly not less than one thousand, who intend to come here as soon as navigation opens in the spring. There are coming into Dawson from up the river daily from twenty to forty men in small boats. It is said by those who have come in last that there are at least one thousand men on the road who have crossed the passes and will winter on the trails and come in early in the spring. From all indications this is a low estimate. In other words, there are here, or near here and to come as soon as roads open, seven thousand men, and there are mines in the district for one thousand. The other six thousand can only hope to work for wages or go long distances from here to prospect. Of all the mines located not more than two hundred and fifty have been proved to be of value under present conditions, and of these many will not be worked full handed until wages are still further reduced. So far as can be learned from the mine owners themselves, about one thousand men will be employed in the mines if wages are $1 an hour. Then as many more will work on lays. In addition to these not more than one thousand will work on their own claims prospecting, developing or mining them, making in all about three thousand men employed in the mines.

Yet it is probable that not so many will have supplies of provisions to last them until spring. Of the rest of the population of the district 1,500 or more will be idle, unless they move out and prospect. When the winter work is over there will be employment for far less men in summer or sluice mining, and with those coming there will be but a small proportion of the men here employed unless new mines are discovered. There have been during the last decade many thousand men in the Yukon country prospecting and mining all the way from the Hootalinqua river to the Koyu-kuk, a distance of eight hundred miles in a straight line. Hundreds have gone away poor in pocket and broken in health by the rigors of the climate, hardships and privations. Up to two years ago but one of all these men had made a respectable amount at mining, and that was only $50,000, made by John Miller, who in three years took that out of his mine on Miller creek in Forty-Mile district. Since then probably half a dozen men have made that much in the Birch Creek district. There are in the Klondike district but few mines that will do better, so far as is known now. There are not more than 250 mines in the district that have been proven to be of sufficient value to work at a profit under present conditions.

All this does not offer much encouragement to those coming here. Yet the Yukon country has been heralded to the world as one of the greatest of mining districts. It certainly is, but the bulk of its yield of bullion will come from mines that to-day and under present conditions cannot be worked at a profit. The high prices, the scarcity of the necessaries of life and the difficulties of travel and transportation make it impossible for poor men or men of small means to work any but exceedingly rich claims. The cost of working is from $5 to $20 per cubic yard. Similar deposits are worked under similar conditions and by almost the same methods in Siberia for 50 cents per cubic yard. Ground worth there $5 per cubic yard pays a high profit. Here it cannot be touched. The mine owners held a meeting two weeks ago, at which it was decided to pay only $1 an hour wages from October 1 to June 1, 1898. Wage earners have held several meetings, at which they have agreed to stand out for $1 50 an hour, and in two cases have compelled men who were working for $1 an hour to quit. A meeting was held by them yesterday, and it was determined to stand out. Neither side up to the present time could tell its strength. The mine owners are better organized, and many of them are in a position to let their mines lie idle rather than pay the higher rates. At Circle City last winter the claim owners were trying to reduce wages to 90 cents an hour, when the Klondike miners offered $1.50. After the dumps had been made or sluicing and stripping was begun for summer work, a number of claim owners on Eldorado attempted to reduce the rate to $1. An informal combine was formed for the purpose, but it happened that many of these men had purchased their claims, paying down a little cash and agreeing to pay the balance by July 1st out of the ground. The days went by and the wage earners refused to work. Soon the lockout was broken and the men went to work at $1.50 an hour. A very few of the mines, and these are nearly all on Eldorado, can pay $1.50 an hour and leave themselves any profit. While the amount of gold that has been produced by the Klondike mines is very large for the number of cubic yards of ground drifted and sluiced, it is much less than has been generally reported. It is safe to say that the total yield, so far, has been less than $3,000,000 from Bonanza and Eldorado creeks. Correct figures might show less than $2,500,000.

In making up estimates that have been published it is often that the sums taken down to San Francisco and Seattle by men who have sold their claims have been counted twice once as a part of the amount mined from the claim it came from, an again as mined by the man who received it as pay for his claim. Again, one hears here of cases where men went away with small sums and have been reported on the outside as having large fortunes. One Government official left here in the summer with $1300. He was reported as having made all the way from $90,000 to $163,000, and he writes back that his poor relations are making life a burden.

Captain Healy, manager of the North American Transportation and Mining Co., estimates that the output of gold from winter drift mining was about $2,000,000, and that from summer sluicing between $500,000 and $700,000. As to the probable yield for the coming winter and summer, the estimates depend upon the number of men that will be employed. If wages shall not exceed $1 an hour and no rich discoveries draw many men away, Edgar Mizner, the secretary of the Mine Owners' Association, says the yield should reach $11,000,000 from these sources: Eldorado, $4,000,000; Bonanza, $4,000,000; Hunker, $1,500,000; small creeks and branches of these and side hill claims, $500,000, and from other creeks in the district, $1,000,000. Captain Healy says that with wages at $15 a day the yield may not exceed $5,000,000, for in that case the richest mines would make small outputs, while the poorer mines, being worked on lays, would not be affected.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SEAL LOCK.—Arthur W. Coffin, San Francisco, Cal. No. 595,093. Dated Dec. 7, 1897. This invention relates to a seal lock which is especially adapted for the closure and sealing of freight and other similar cars or treasure chests when in transit between the forwarding and receiving stations to prevent the removal or tampering with the contents, and to afford a means of detection in case the receptacle has been opened. It consists essentially of circular disks, a central pivot uniting them whereby they are turnable with each other, a catch or latch by which they are allowed to turn in one direction only, a loop or staple formed of sections, one of which projects through each of the disks, the ends of the sections adapted to unite to form a continuous loop, hoops projecting from said sections turning outwardly, and a slotted metallic strip fitting over the ends of the hooks so as to be locked when the loop or staple is closed, it being necessary to break this connecting band whenever the lock is moved to the open receptacle, thus showing that it has been opened.

CLAMP FOR GARMENT SUPPORTER.—Charles M. Allen, San Francisco, Cal. No. 595,032. Dated Dec. 7, 1897. This invention relates to a novel clamp for garment supporters. It consists essentially of a plate having a boss or projection centrally upon one side, a fold or bend at one end serving as a resilient member adapted to receive the end of the supporting elastic or strip between itself and the body of the plate, teeth formed in the bent-over portion to engage the end of the strip when inserted, a transverse slot at the opposite end of the plate through which the strip is passed, a clasp adapted to surround the projecting head and having a tranverse loop at the upper end through which the suspending strip is passed after passing through the plate and again returned through the slot in the plate so that it serves as a hinge about which the clasp is turnable. Diverging extensions project from the clasp and a button is sildable upon these extensions so as to close and bind the fabric about the projecting head.

CENTRAL STATION COMBINED TELEGRAPH AND TELEPHONE SYSTEM.—A. C. Robbins, San Francisco, Cal.: assignor to E. C. Hughes, same place. No. 595,241. Dated Dec. 7, 1897. This invention relates to improvements in central station combined telegraph and telephone signal systems. It is especially applicable to fire and police telegraphs, and consists of a fulcrumed lever at the central station with a suspended removable receiver and contacts at opposite portions of the lever alternately made and broken by the suspension and removal of the receiver, an alarm and local battery circuit at the central station for operating the same, a relay actuated by the main line current and controlling contacts in said local circuit, and an independent contact with which the said lever engages, said last-named contact being closed when the receiver is suspended and opened when the receiver is removed. In conjunction with these devices are two batteries, one weaker than the other, and bell or alarm connections which are normally non-acting when the weaker battery is in connection with the line, but which are sounded at both central and sub-stations when the stronger battery is in action..

BICYCLE BUNDLE CARRIER.—Abram W. Duck, Oakland, Cal. No. 594,683. Dated Nov. 30, 1897. This invention relates to a carrier which is especially adapted for use upon bicycles. It consists of a wire frame so bent from a single piece of wire as to form a suitable support for bundles, and having the ends bent so that by the elasticity of the carrier these ends are caused to engage with the inclined rear posts of a bicycle frame, and, by thus interlocking with it, to hold the carrier with proper relation thereto. In connection with this elastic single-piece frame is a cord which can be carried over the bundle and attached to a portion of the framework beneath the saddle, thus holding the package firmly and conveniently for transportation.

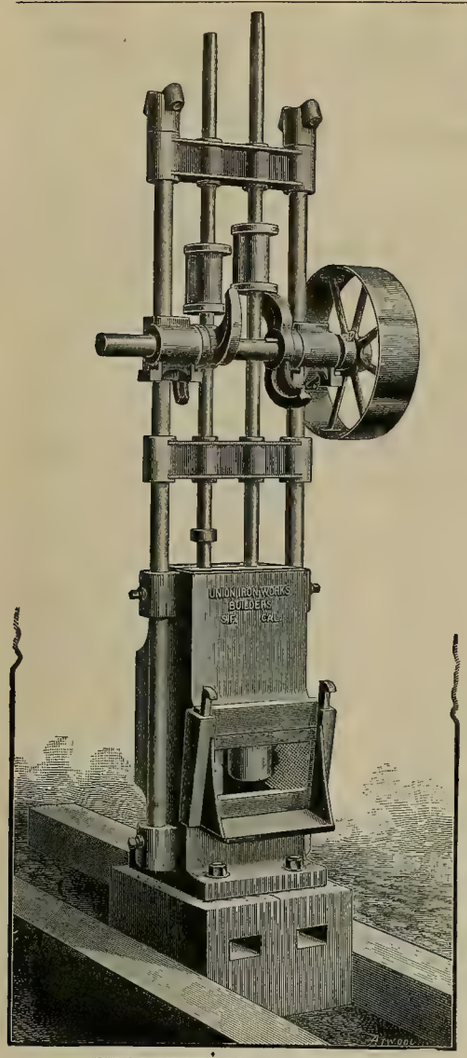
AIR BRAKE GOVERNOR.—A. C. Rumble, Oakland, Cal., assignor to the California Air Brake Governor Co. No. 595,251. Dated Dec. 7, 1897. This invention relates to a device which is designed to control the brake mechanism of railway cars by means of an automatically operating mechanism whereby the pressure of the air and the consequent pressure of the brakes upon the wheels is regulated. It consists of a substantially closed cylindrical casing journaled with its periphery in contact with the car axle, tubular journal connections with said casing, a relief valve contained in the casing to be opened and closed by the varying speed of rotation of the car wheels and in conjunction therewith of a centrifugally acting governor by which the valve is operated.

ELECTRIC ELEVATOR CONTROLLER.—C. M. Weyman, San Francisco, Cal., assignor to the Cahill & Hall Elevator Co. of same place. No. 595,086. Dated Dec. 7, 1897. This invention relates to a means for controlling the movements of electrically actuated motors, especially when connected with elevators, and which I call "an electric elevator controller." It consists of the combination with an electric motor and an elevator mechanism moved thereby of solenoids having movable cores, mechanism actuated by the cores whereby contacts are produced and the direction of the motor first established, a controlling device by which both armature and field resistance are varied proportionately to the desired motor speed, and an automatic operating device comprising an electric clutch within the circuit which is established through the solenoids and intermediate mechanism whereby the controller is disengaged and returned to its normal position

DEVICE FOR PRESERVING PERISHABLE ARTICLES. J. S. Johnson, San Francisco, Cal. No. 595,174. Dated Dec. 7, 1897. This invention relates to a means for preserving perishable articles, such as flesh, fruits, vegetables, etc. It consists essentially in a means for exhausting air from containing vessels and thereafter sealing the same, this means consisting of a suction pipe adapted to be connected with an exhaust apparatus at one end, a means for connecting the opposite end with a conical tapering opening which leads to the can or vessel to be sealed, so that air can be exhausted therefrom, and a means for applying a plug or stopper of sealing material to hermetically close the opening after the exhaustion is complete and before the exhausting apparatus is removed.

Colorado's Gold Fields, Illustrated.

Just out, with correct map and nearly 100 mining views natural as life. This valuable book will be sent free, prepaid, with our big 56-col. family paper 3 months on trial for 25c: club of 5 and 5 books $1. Latest mining news. Mention THE PRESS and address *Illustrated Weekly Sentinel*, Denver, Colo. Cripple Creek is fully described.



PROSPECTING BATTERY.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

THIS : :

Two-Stamp Self-Contained Battery

IS DESIGNED BY

THE UNION IRON WORKS

Expressly for Prospecting Work.

It was awarded First Prize at the recent Mechanics' and Manufacturers' Fair, where it was in daily operation, crushing ores from various mines throughout the State.

Weight of stamps, 275 pounds each; capacity of battery, determined by actual work, 200 pounds per hour, through a No. 7 slot-punched screen.

Entire battery weighs about 3000 pounds; heaviest piece, mortar, weighing 1200 pounds.

Can be taken apart and transported to any locality.

CONSOLIDATED

Kansas City Smelting and Refining Co.

Incorporated Under The Laws of New York.

Capital paid in..... $2,700,000.

Buyers of All Classes of

GOLD, SILVER, LEAD AND COPPER ORES,

Bullion, Mattes and Furnace Products,

GOLD BARS, SILVER BARS and MILL PRODUCTS.

BAKER & HAMILTON,

HIGH GRADE
Engines, Boilers,
Ice Machines,
Mining Tools,
ETC., ETC.

THIS CUT represents our Single Engine **PROSPECTORS' HOIST,** from 6 H. P. up, constructed with sectional iron frame, reversible link motion, improved brake, etc. Engine and Boiler can be disconnected and used for other purposes. Hoist and Engine can be shipped knocked down, in pieces suitable for transportation over difficult roads and trails.

We also carry Double Engine Hoists, same type, with or without Boilers, from 12 H. P. up.

These outfits are built in the most substantial manner possible, and on the most approved principles. We recommend them in every particular.

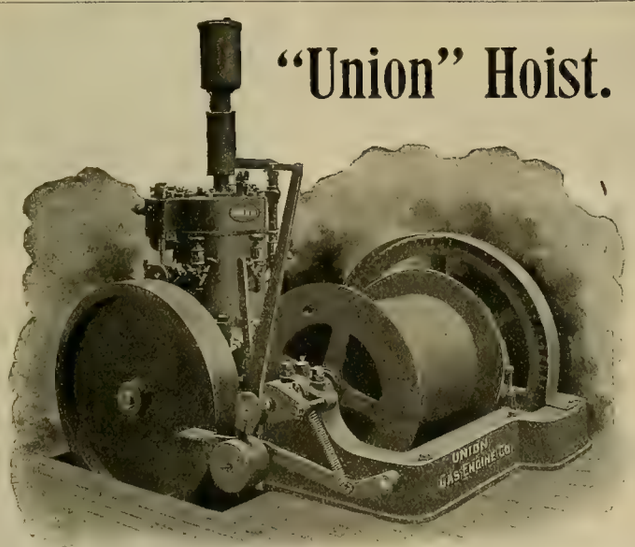
WRITE FOR PRICES; THEY WILL INTEREST YOU.

SAN FRANCISCO, CAL.

BRANCH HOUSES.....SACRAMENTO AND LOS ANGELES.

FACTORY: BENICIA, CAL.

"Union" Hoist.



The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over600 feet of ⅝-inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.

—BUILD THE—

"Union" Gas Engines,

Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. Pacific Placer Machine.
Patented APRIL 20, 1897.

KLONDIKE MACHINE.—If you are going to placer mining in Klondike or any other country, you cannot afford to be without one of these Machines. It will work any class of placer ground, river or sea sands, and save the fine float gold as well as the coarse. The material is graded in four different grades in passing through the Machine. The coarse gold is caught in the riffles above the plates; a double screen is arranged above the plate and amalgamating cylinder, allowing nothing but the water and fine material to pass onto the amalgamating plate and cylinder. This is the Machine for dry countries, as it requires but a small amount of water. By attaching one of our small pumps the Machine will supply its own water from streams or well and raise water 20 feet. One miners' inch of water will supply our larger Machine by using the water over. Will work 40 to 50 tons per day. Can be run by hand or power. Built in three sizes. Price $150, $300, $450, f. o. b. S. F. Capacity 10, 25, 40 tons per day. Weight 175 lb, 400 lb, 650 lb. Manufactured for both quartz and placer. Send for Catalog. PACIFIC MINING MACHINERY CO., 127 First St. S. F., Cal

Western Branch, Denver, Colo.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'S Patent Agency will have the benefit of a description in the *Mining and Scientific Press.* We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

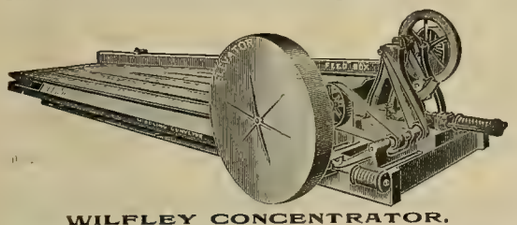
Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

PRICE $450 F. O. B. San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.



WILFLEY CONCENTRATOR.

SEND FOR CIRCULARS.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, barring none.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

Assaying Gold
.....AND.....
Silver Ores.
THIRD EDITION JUST OUT.
A Standard Work.
By C. H. AARON.
This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the pratical miner can mistake his meaning.
The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.
Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay: Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price **$1.00** postpaid. Sold by the **Mining and Scientific Press**, 330 Market St., San Francisco.

Market Reports.

The Markets.

SAN FRANCISCO, Dec. 16, 1897.

The closing days of 1897 are marked by a fair degree of activity for the time of the year in all lines of trade. Jobbers and retailers state that stocks carried are light, which necessitates almost constant filling in. It is this that stimulates the demand for and will compel free buying in February and March of next year. The only exception to the rule of light stocks is by many jobbers carrying liberal supplies of goods that were purchased at lower prices and of goods which were expected to fetch more money at an early date. It is the consensus of opinion that next spring there will be a larger demand for goods than before known and the buying will be mainly for cash. It is conceded that all sections of the coast will increase their orders, but more particularly Alaska, owing to the expected heavy rush of people there. The export movement is also expected to increase.

The local money market is easy, with the supply of money still accumulating. Although the market is easy, yet banks and capitalists are slow to put out funds except on the best of security. This conservatism is forced by fears that Congress may do some overt act which might have an unfavorable effect on the money markets at home and abroad, and retard the growing feeling of confidence. After the present session has advanced further, and fears now entertained are proven groundless, then there will be a disposition to put out funds, which will have a stimulating effect on all industries, branches of trade and general speculation. The steamer from Australia brought nearly $2,000,000 in gold. The New York money market is practically unchanged. The supply of available funds is large, while the demand is light. The European money markets continue somewhat unsettled by reason of political complications and Russia's continued absorption of gold.

New York Silver Prices.

NEW YORK, Dec. 16. — Following are the closing prices for the week:

	—Silver in— London.	N. Y.
Friday	26⅜	58
Saturday	26⅜	58¼
Monday	26⅜	58⅜
Tuesday	26⅜	57⅞
Wednesday	26 5-16	57
Thursday	26¼	56¾

	Copper.	Lead.	Iron.	Tin.
Fri.	10 80 @10 95	3 70	10 00@12 25	13 75
Sat.	10 80 @10 95	3 70	10 00@12 25	13 75
Mon.	10 80 @11 00	3 67½	10 00@12 25	13 72½
Tue.	10 80 @11 00	3 70	10 00@12 25	13 70
Wed	10 80 @11 00	3 72½	10 00@12 25	13 70
Thur.	10 80 @11 00	3 72½	10 00@12 25	13 70

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	6
Commercial Loans, prime	5
Call Loans, gilt edged	4@4½
Call Loans, mixed securities	5@6
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	12½c Prem
New York Telegraphic Transfer	15c Prem
London Bankers' 60 days	$4.83¼
London Merchants	$4.82
London Sight Bankers	$4.86
Refined Silver, per oz. 1000 fine	57
Mexican Dollars nominal	46½

SILVER.—The market has weakened off some in sympathy with London. The decline there is said to have been brought about by the India Council having determined to resume the sale of bills. This shows how sensitive silver is for with no unfavorable influence the market stiffens but as soon as there is any adverse influence then it goes off. This indicates that the supply is not large. The demand in our market is only fair.

Silver sold in the New York market last week at 60 cents an ounce for commercial bars. This is the highest price since July last, and represents an advance of nearly nine cents an ounce since Sept. 1st. The strength exhibited by the market for silver recently is ascribed to large silver shipments from London to Russia, which country has been for some time past at work putting its currency upon a metallic basis; a revival in volume of the demand from China, a continued good demand from India and an increasing demand for use in the arts. The production of silver at the same time has not increased.

MEXICAN DOLLARS.—The market holds fairly firm at from 46½ to 47 cents for new in quantities.

COPPER.—The market is quiet but steady. The Eastern market is confined largely to small export sales. A late New York circular letter says: Manufacturers have been busy, with the brass and copper mills well employed. Interest is beginning to manifest itself regarding the price basis on which the next sales by the Calumet & Hecla will take place. Former guarantees undoubtedly checked negotiations, especially when the market slid off, but business treaties may now soon be resumed, with what results remains to be seen.

Our market is quoted as follows:

Ingot casting, jobbing	13 @—
Ingot " wholesale	12½@—
Sheet copper	— @16½
Bolt	¼ and 5-16, 20c; ⅜ and larger, 16½

TIN.—The market is quiet for spot but fairly active for future delivery for both pig and plate.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " " light, "	4 00@—

SHOT.—The market is steady.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 40
Drop, B and larger sizes, " "	1 65
Buck, Balls and Chilled, do, " "	1 65

POWDER.—The market is steady with the factories running to full capacity so as to meet the call from the mines.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¼c, according to strength and quantity; No. 2, from 9 to 11c, according to strength and quantity.

QUICKSILVER.—The market is quiet but steady. The last steamer for Australia took out 10 flasks for New Zealand.

Our market is quoted at $39 for domestic consumption and $35@36 for export to the west coast of Mexico.

LEAD.—The market has ruled fairly steady, but at the close it is firmer in sympathy with New York, where slightly better prices rule.

Our market is quoted in jobbing lots as follows per 100 pounds:

Pig	4 75	@	5 00
Sheet	6 30	@	6 80
Pipe	5 60	@	6 10

IRON.—The local consumption is about the same. One hundred tons of pig came in the past week from England. Eastern advices state that the consumption continues free, with an increase looked for next year.

AMERICAN.	To Arrive.	Spot.
Sloss	$20 00	$22 00
Thomas	21 00	22 00
Salisbury	29 00	31 50
ENGLISH.		
Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

NAILS.—The market is steady at quotations. The demand is slow.

We quote the following basis: 20d to 60d, inclusive—wire $2.50, cut $2.40.

COAL.—There is nothing new to report. Colder weather has increased the demand for household but the market remains steady at combination quotations.

Receipts of Coal for the week ending Tuesday were as follows in tons: Puget Sound, 6700; Nanaimo, 4422; Newcastle, N. S. W., 3527; Swansea, 2520. Total, 17,270.

We quote as follows:

SPOT FROM YARD—PER TON.	
Wellington	$8 00@— —
Greta	6 00@ 6 50
Nanaimo	6 50@— —
Gilman	5 50@— —
Seattle	5 50@— —
Coos Bay	— —@ 4 75
Cannel	9 50@— —
Egg, hard	12 00@— —
Wallsend	6 75@— —
TO ARRIVE—CARGO LOTS.	
Australian	5 75
Liverpool Steam	6 75
Scotch Splint	7 50
Cardiff	7 50
Lehigh Lump	12 00
Cumberland, bulk	10 50
Egg, hard	9 50
West Hartley	6 75

COKE.—The market is easy. Imports the past week aggregate 1294 tons from Newcastle, England.

The market is quoted as follows:

Gas Companies'	— —		— —
English, to load	— —	@	— —
" spot, in bulk	11 00	@	— —
" in sacks	12 00	@	— —
Cumberland	10 00	@	— —

PLATINUM.—The market is steady.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

BORAX.—The market is firm, with an active shipping demand. The East reports strong markets.

The market is quoted as follows:

Refined, in carload lots, in barrels	6
Refined, in carload lots in sacks	5¾
Powdered, in car lots	6¼
Concentrated, "	5½

ZINC.—The market is firm.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

ANTIMONY.—The market is steady.

Our market is quoted at 8½c in a jobbing way. New York mail advices quote 8c for Cookson's, 7½c for Hallett's and 7c for Japanese.

Chemicals.

New York mail advices report as follows: Bromide of ammonium has advanced to 54@55c. Bromide of sodium has been advanced to 49@50c, while purchases from second hands can still be made at a shade from manufacturers' prices.

Our market is reported the same as for several weeks past, with no particular change looked for until after the turn of the year.

SULPHURIC ACID.—The demand is quiet.

We quote in a jobbing way at 1½c per lb for 66%.

ACETIC ACID.—The market is steady at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported firm from store at 6½@7c per pound in carboys.

BONEASH.—There is a slow demand.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

BLUE VITRIOL.—Our market is steady, with better inquiry.

We quote in a jobbing way at 4c per pound.

SPELTER.—The market is steady.

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is firmer.

Our market is quoted in a jobbing way at $1.40 a pound.

SODA ASH, 58% (LeBlanc process).—The market is steady at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is steadier at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—The market is quiet at 2½c a pound from stores.

NITRATE OF SODA.—The market is slow and in buyers' favor for spot.

Our market is quoted from store at 4c for 95%.

PHOSPHORUS.—The market is easy.

We quote in a jobbing way at 70 to 75 cents per pound.

Mining Share Market.

SAN FRANCISCO, Dec. 16, 1897.

The market dragged to still lower figures the past week, proving correct our assertion that lower figures would rule befor a good sized substantial rally. At this writing it looks as if still lower figures will rule for some of the higher priced shares, but there are some notable in the Gold Hill group that are about as low as they generally get, for experience has taught that at around present low prices there is big money in them before winter months pass, and the writer hazards the opinion they are good purchases now even if they should go slightly lower. Everything points to moneyed insiders being after shares, for shares they want and shares they will have. The brokers are helping them, too. Pointers are quietly putting out all kinds of bad reports, the most widely spread being that the Comstock mines have "petered out." This has been the case many times within the past thirty years, but as many times have they proven the assertion false, and will again. The truth is it is impossible to know when a mine is exhausted, which mining in this State proves for many abandoned mines are large dividend payers now. Few thought in 1870 that there was any ore in Crown Point or Belcher on the Comstock, below the depth they were then working, but the largest value of metal from those mines was subsequently discovered and removed and dividends paid. This caused more persistent work elsewhere which led to the large ore deposit in Con. Virginia and California, from which large dividends were paid and sent the shares of twenty-three leading mines from about $5,000,000 to over $270,000,000. Two years after the highest prices the same mines sold down to $30,000,000 only to recover to $114,500,000 in the Sierra Nevada deal, which sold up to over $280 a share. Preceding the Con. Virginia deal in 1886, the shares of the twenty-three mines sold on the basis of about $1,500,000. When the deal was at its height they sold at over $40,000,000. These are only given to show that the Comstock mines have as many lives as the proverbial cat, and least looked for, the shares go from absurdly low prices up to big figures. There is very active work going on in the Comstock mines and it is quite safe to affirm that such shrewd and successful financial men as D. O. Mills, John W. Mackay and Col. Alvinza Hayward, and others, would dispose of their milling and other interests on the lode if they did not believe that history will repeat itself again. But what worries outsiders is as to when the "repeating" will be done. Some say next year, others say after international bimetallism is an accomplished fact, but the writer says no person, unless it be the moneyed inside, knows, for if they develop a lode of gold bearing ore, which old miners say they will, then a big deal will result irrespective of any other consideration.

News from the Comstock mines is practically unchanged so far as official letters are concerned, but private advices from seemingly reliable sources are quite encouraging, yet they point to time. It is stated that soon after the turn of the year more work will be started in two or more of the mines. The official letter from Utah reports continued work in a northwesterly direction with fairly favorable formation. In Sierra Nevada on the 900-foot level west crossdrift No. 5 has been started, but work is continued in the north lateral drift. The new tunnel is being pushed. No change in the work on the Layton tunnel level. The only work reported in Union is the west crossdrift on the 900-foot level. They are still running east from the 1000-foot level of Mexican. In Ophir work is confined to the 1000-foot and Central tunnel levels. There is no change reported in the official letter. Active and energetic work is continued in Con. Virginia on the 1550-foot, 1650-foot and 1750-foot levels. From the general tenor of the official letter it looks as if it will not be the superintendent's fault if a development is not made. A few tons of ore were raised assaying over $30 to the ton. Nothing new from Best & Belcher. They continue to extract low grade ore from the 400-foot Bonner shaft level. A new process of working Comstock ore is reported, which, if correctly stated, will revolutionize that entire district and set many hundreds of miners to work. Work reported in Savage is practically unchanged. Hale & Norcross is still idle, but contestants down here are not. It looks as if active exploiting work will be started soon in Chollar as the repairs which they have been making are about finished. If the work is properly run good results will follow. They are drifting south in Potosi on the tunnel level and driving west from the sixth floor above this level. In Alpha the northwest drift was, at last advices, in low grade ore on the 500-foot level. They are still going west in Con. Imperial on the surface tunnel. Fair progress is being made in the joint Challenge, Confidence and Con. Imperial west crossdrift. They are in nearly 1700 feet. They continue to kill time in Yellow Jacket. The strike of ore has not been reported officially to the public. This will be done when the shares have been bought up. In Crown Point they are doing dead work so as to get the mines into better shape for exploiting. In Belcher they are running west on the 1200-foot level and west on the 850-foot level. They are extracting a few tons of ore. From Overman and Seg. Belcher nothing new has come to hand. In Justice they are running for the ore found above while doing other work of a development character.

The work on the Brunswick is practically unchanged, although it is being done energetically by the different companies. The joint Con. Virginia, Best & Belcher and Gould & Curry work is confined to the 300-foot and 600-foot levels. In Savage active exploiting work is being done. In Chollar and Potosi there is no change reported. In the former they are taking out a few tons of ore and continue to send bullion to the mint. The joint work by Chollar and Potosi is watched with interest. The official letter from Occidental reports that on the 750-foot level they are in fair grade ore. No change is reported in the other levels.

595,086.—ELEVATOR CONTROLLER—C. M Weyman, S. F.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

WANTED

POSITION AS SUPERINTENDENT OF GOLD Mining property, quartz or gravel, or would travel as expert for good company. Address, "EXPERT," MINING AND SCIENTIFIC PRESS, San Francisco.

WANTED.

LOW PLACER GROUND

IN CALIFORNIA, FOR DREDGING PURPOSES.

Must Exceed 50 Cents per Cubic Yard.

Send full description with price and terms to

W. H. BARRY,.....Pasadena, Cal.

FOR SALE, AT A BARGAIN.

A complete Champion Prospecting Diamond Drill Outfit. Good as new. Used very little. Does successful work. For price apply to GOLD HILL MINING CO., Angels Camp, Cal.

FOR SALE CHEAP.

First-Class Air Compressor (Steam driven) and Drill, New.

Also, 3-Ton Capacity Pulverizer.

A. L. FISH, 59-61 FIRST ST., San Francisco.

NEWSPAPER ADVERTISING IN THE UNITED STATES. A book of two hundred pages, containing a catalogue of about six thousand newspapers, being all that are credited by the American Newspaper Directory (December edition for 1897) with having regular issues of 1000 copies or more. Also separate State maps of each and every State of the American Union naming those towns only in which there are issued newspapers having more than 1000 circulation. This book (issued December 15, 1897,) will be sent, postage paid, to any address, on receipt of one dollar. Address The Geo. P. Rowell Advertising Co., 10 Spruce St., New York.

MINE BELL SIGNALS.

Adopted, Used and in Force in Accordance with State Law.

For the convenience of our readers in the mining counties we print in legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco.

Assessment Notices.

RED CAP MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Red Cap Creek, Humboldt County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 29th day of November, 1897, an assessment (No. 2) of Five Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, No. 125 Beale street, city and county of San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of January, 1898, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on SATURDAY, the 29th day of January, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

H. H. MARTIN, Secretary.

Office—125 Beale street, city and county of San Francisco, California.

ALTA SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Gold Hill, Gold Hill Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3d day of December, 1897, an assessment (No. 58) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of January, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 28th day of January, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. E. JACOBUS, Secretary.

Office—Room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 7th day of December, 1897, an assessment (No. 29) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of January, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 1st day of February, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

DELINQUENT SALE NOTICE.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 8) levied on the 28th day of September, 1897, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
A. F. Frey, Trustee	178	4,200	
Balance due.			43 10
A. F. Frey, Trustee	211	100	2 50
R. Z. Johnson	385	1,525	38 13
Emma Rosenbaum	325	1,000	25 00
Emma Rosenbaum	326	300	7 50
Emma Rosenbaum	327	200	5 00
Fr. H. Rosenbaum	343	417	10 43

And in accordance with law, and an order from the Board of Directors, made on the 28th day of September, 1897, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, room 44, Phelan building, San Francisco, California, on MONDAY, the 27th day of December, 1897, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

ANNUAL MEETING.

The Regular Annual Meeting of the Stockholders of the Gould & Curry Silver Mining Company will be held at the office of the Company, Room 69, Nevada Block, No. 309 Montgomery Street, San Francisco, California, on MONDAY, the 20th day of December, 1897, at the hour of 1 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting.

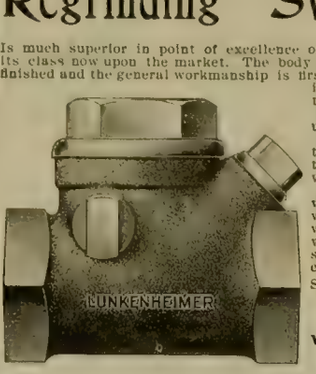
Transfer books will close on Friday, December 17th, at 3 o'clock P. M.

ALFRED K. DURBROW, Secretary.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from George Rieber, in the Badger Hill Mine, near Placerville, El Dorado Co., to deposit tailings in Iowa Canyon; from F. W. Cook, in the Try Again Mine near Placerville, El Dorado Co., to deposit tailings in a ravine; from Matt Yoner, in the Hoosier Mine near Georgetown, El Dorado Co., to deposit tailings in Bear Creek; from Otto Reichel, in the Mountain Ranch Mine near Mountain Ranch, Calaveras Co., to deposit tailings in a ravine; from J. F. Gurney et als., in the Johnston Placer Mine near San Andreas, Calaveras Co., to deposit tailings in a ravine; and from J. G. Underwood and W. N. Lamb, in the Chris Limpher Mine near Plymouth, Amador Co., to deposit tailings in Indian Creek, gives notice that a meeting will be held at Room 69, Flood Building, San Francisco, Cal., December 27, 1897, at 1:30 P. M.

LUNKENHEIMER'S
Regrinding Swing Check Valve

Is much superior in point of excellence of material, design and workmanship to any other valve of its class now upon the market. The body is heavy and well proportioned, the seat is carefully finished and the general workmanship is first-class. This valve is so designed that when the disc is raised the passage through the body is fully equal to the diameter of the connecting pipes.



Particular attention is called to the quality of metal used, it being the best gun metal composition.

By means of the regrinding feature the usefulness of the valve can be prolonged indefinitely. When worn in the seat the valve can be reground without removing valve from connecting pipes.

The regular pattern of this valve is guaranteed to stand a working pressure of 175 lbs., but we also make a line of extra heavy valves of this kind to stand pressures up to 350 lbs. All valves are carefully tested and warranted. Specify "Lunkenheimer" make. Supplied by dealers everywhere.

Write for Catalogue of Steam Specialties.

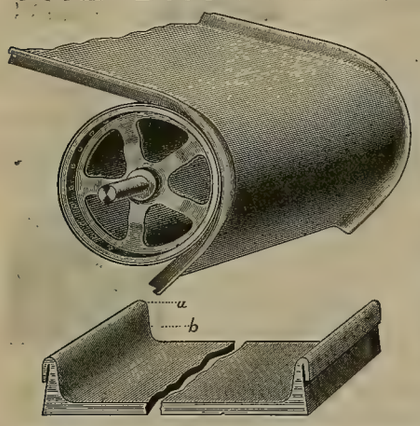
THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.



It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

RAWHIDE GOLD MINING COMPANY,
JAMESTOWN, TUOLUMNE CO., CAL., Feb. 21, 1897.

J. S. BROWNELL, ESQ.—DEAR SIR: Replying to your query of Feb. 15th, will say that I have used your Patent Lip flange belt more than one year, and judging from their appearance after more than one year of hard service, I do not hesitate to say that they are the best belt I have ever used and I take great pleasure in testifying to the fact. Yours truly, W. A. NEVILLS, President.

AMADOR CITY, CAL., Feb. 18, 1897.

MR. J. S. BROWNELL—DEARR: I take pleasure in saying that I have used your Patent Lipped flange belt for several years while connected with this company, and I consider them the best that we have used. The quality of rubber in the flange seems to be the best, and we are not bothered with the flange cracking and thereby destroying the life of the belt. At present we are using 14 concentrators, and have in use several kinds of belts. We consider your Patent Lipped flange the best. Yours very truly, THE CONS. SOUTH SPRING HILL G. M. CO.
By JOHN R. TREGLOAN, Superintendent.

For any information regarding Frue Vanner or Belts, call on or address

JAS. S. BROWNELL, Western Agent FRUE VANNING MACHINE CO.

MINING AND SCIENTIFIC PRESS.
AND PACIFIC ELECTRICAL REVIEW.

No. 1955.—VOLUME LXXV. Number 26. SAN FRANCISCO, SATURDAY, DECEMBER 25, 1897. THREE DOLLARS PER ANNUM Single Copies, Ten Cents.

Vein Structure Nevada and Amador Co.'s.

Illustrated notice of vein structure in Nevada Co., Cal., compiled from the 17th report of the U. S. Geological Survey, appeared in the issues of Nov. 6 and Dec. 11, referring more particularly to pay shoots. The subject which is a very interesting one to gold miners the world over is again referred to and illustrated herewith.

Fig. 1 is engraved from a flashlight photograph of half a dozen miners at work on several small quartz developments between the foot and hanging wall near the 1800-foot level of the Ophir Hill vein, Empire mine, Nevada Co., Cal., such seams often, as in this case, yielding extraordinarily in net return of gold. Of course, it is understood that in those veins the development of gold is not confined to the ore shoots. The vein preserves its general character over considerable area, but only in part of that area does the quartz contain enough gold to be profitably extracted as ore. In another and smaller class of veins all quartz occurring in the vein is good ore, and outside of the ore shoots the vein closes down to a seam. The question what grade of quartz is regarded as "good ore," determines the practical extent of such pay shoot. In early days it had to be very good ore that would pay; now, anything over $5 per ton—the average cost of deep mining and milling—is considered worth working.

It is a general characteristic of those ore shoots that they have an elongated shape, forming an angle with the horizontal plane, which generally differs slightly from the dip of the vein, that is, the shoot pitching at a steep angle on the plane of the vein, the following law appearing to govern the general direction: The shoot will, as a rule, pitch to the left of an observer standing on the apex of the vein and looking down in the direction of the dip. While this is by no means an infallible rule, yet it holds good in so many instances that it may be considered as a general result of some yet unknown cause, and is deemed worthy of mention herein and of note on the part of the California miner.

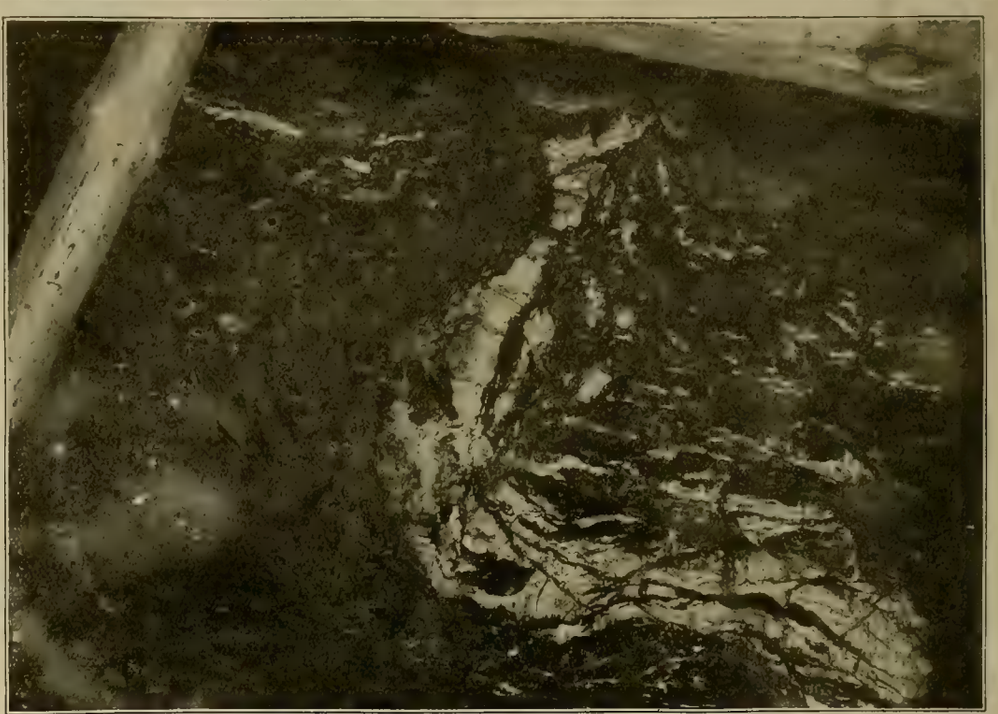

FIG. 2.—BUNKER HILL VEIN, AMADOR CO., CAL.—STOPES ABOVE 300-FOOT LEVEL, SHOWING VEIN SPLIT UP INTO SEAMS IN BLACK, CRUSHED CLAY-SLATE.

FIG. 1.—OPHIR HILL VEIN, EMPIRE MINE, NEAR 1800-FOOT LEVEL, SHOWING SEVERAL SMALLER VEINS BETWEEN FOOT AND HANGING WALLS.

Fig. 2 affords an interesting view of another vein structure which frequently appears in the soft, black slates of the Mariposa formation along the mother lode, lying along the contact of black slate and diabase, separated by a distinct hanging wall of the latter. Rarely is there a continuous, well-defined vein, the black slate being sometimes crushed over a width of 20 feet in the manner shown in the engraving from a flashlight photo taken in a stope above the 300-foot level in the Bunker Hill mine, Amador Co., Cal. While the pay ore is in the quartz, yet, it is found necessary to mine the whole mass, which thus constitutes low-grade ore. The cut also shows a curious curve of the principal mass of quartz, due possibly to movement subsequent to deposition.

MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Oldest Mining Journal on the American Continent.

Office, No. 330 Market Street, San Francisco, Cal.
Telephone Number, Clay 204.

ANNUAL SUBSCRIPTION:

United States, Mexico and Canada..... $3 00
All Other Countries in the Postal Union..... 4 00

Entered at the S. F. Postoffice as second-class mail matter.

J. F. HALLORAN.....General Manager

San Francisco, December 25, 1897.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Ophir Hill Vein, Empire Mine, Near 1800-Foot Level, Showing Several Smaller Veins Between Foot and Hanging Walls; Bunker Hill Vein, Amador Co., Cal.—Stopes Above 300-Foot Level, Showing Vein Split Up into Seams in Black, Crushed Clay-Slate, 593. Miner Boating Down the Yukon; Klondikers Arriving at Fort Yukon, 596. Iron Safety Sinking Cage, 600.

EDITORIAL.—Vein Structure Nevada and Amador Cos., 593 Map of the Klondike Region; The Modern Alchemists; Miscellaneous, 594-595.

MINING SUMMARY.—From the Various Counties of California Nevada and Other Pacific Coast States and Territories, 598-99.

MECHANICAL PROGRESS.—Water Power and Momentous Changes; Advantages of Hydraulic Riveting; Safety Sinking Cage; Dust in the Bearings of Elevators; The Largest Penstock Ever Used; Growing Demand for Gas Engines; Winding Steam Pipes; The Chainless Bicycle; Method for Construction of a Connecting Rod, 600.

ELECTRICAL PROGRESS.—How to Become an Electrical Engineer, 601.

SCIENTIFIC PROGRESS.—Long-Distance Telephony and the Railroads; A Railroad That Lifts Itself; An Arizona Pickling Plant; The Longest Telephone System in the World; The Ramie Plant, 601.

THE MARKETS.—Eastern and Local Markets; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 614.

MISCELLANEOUS.—Hydraulic Mining; On the Yukon River and at Fort Yukon, 596. Notes on Present Western Practice of Metallurgy Economically Considered; Experiments in Boiler Bracing; Tunnel Under Irish Channel, 597. Manganese Ores, 601. Amending Federal Mining Laws; To Color Iron Blue; Proposals Invited for Electrical Apparatus; Coast Industrial Notes, 602. Recently Declared Mining Dividends; Recent California Mining Incorporations; Personal, 603. Index to Volume, 614-15-16.

Map of the Klondike Region.

With the compliments of the MINING AND SCIENTIFIC PRESS is sent in this issue to our readers a corrected map of Alaska, the Northwest Territory, the Klondike, etc., up-to-date and believed to be reliable. It was lithographed specially for this paper. This brief reference is made to it to direct the attention of our subscribers to the fact that, folded in each copy of the paper of this date, is the map, and, also, to comply with the requirements of the Postoffice officials in such matters.

SINCE Oct. 1, '97, this paper has refused several pages of proffered advertising, chiefly from concerns who have nothing of value to sell and seek only to delude and get something for nothing. An advertisement in this paper has long been justly regarded as good evidence of the advertiser's standing and the value of what is offered intending purchasers.

SOME interesting points were brought out recently in a case in the Superior Court of Yuba county, Cal., where suit was brought against Charles Stepp and others in San Francisco to recover judgment for supplies to a mine, which, it was claimed, defendants owned. The plaintiffs proved that Mr. Walrath, the Superintendent of the mine, had bought the supplies, and claimed that they had sold these supplies, believing defendants were owners. Defendants denied that they had employed Mr. Walrath and that there was any such company in existence as the Faust Mining Company, under which name the suit was brought. Mr. Stepp, as witness, explained that the mine had been bonded by Mr. Walrath and two others and that they (the defendants) had advanced $7000 to the bonders for the Dalton mine, intending to purchase that if it turned out well; but that there had been no profits and a great deal of loss. Mr. Stepp said that in case of profits, they would have divided them; but, as a matter of fact, they were out of pocket and at a great expense. He incidentally stated that he was interested in several mines and had recently staked four men $1000 apiece to go to the Klondike. Plaintiffs argued that, although they had not proved a partnership, they had at least proved a liability; that defendants would have been responsible had the mine turned out profitable, and would have shared the profits. Defendants contended that three other parties had bonded the mine and had wanted to sell it to the defendants, they (the defendants) paying $7000; but they had no present property interest therein. The Judge this week decreed that plaintiffs recover from three of the defendants the amount sued for, with costs, exempting Stepp and Walrath from the judgment, which, in effect, was that the latter, as superintendent, was authorized to act as purchasing agent, and his contracts and agreements must be kept by the incorporation he represented.

The Modern Alchemists.

From the number of letters received at this office it is evident that some credence has been given to the recent claims of sundry "manufacturers of gold." The matter is deserving of further attention to that already given it in these columns.

It is assumed at the outset that those of present prominence in the matter are honest in their convictions and have no desire to defraud the public. They have said what they say so many times that they have come to believe it themselves. No matter how extravagant a statement, if one will continue to state it he will ultimately come to individual personal belief therein.

The whole subject belongs more properly to the middle ages than to these sunset years of the nineteenth century, and is a singular illustration of the survival of the unfittest. There is, doubtless, a strain of superstition running through the centuries—the superstition in this case being intensified ignorance. Tennyson says that he "doubts not through the ages one increasing purpose runs." This record of folly and failure from the days of Aristotle to those of Emmens, Brice and Marshall shows no increasing purpose, but rather sounds the fainter echoes of a former widespread faith.

Through the centuries has existed a belief in the possibility of prolonging life by an artificial elixir, and of turning baser metals into gold. This belief was largely fostered by learned impostors on the same principle that the ridiculous claims of the Keeley motor have been rewarded by financial assistance during the last quarter of a century—it being as characteristic of charlatans of the ninth as of the nineteenth century to play on the credulity and avarice of the masses.

It has been said that such men as Brice, Emmens and Marshall are doubtless sincere and are not to be classed among dishonest impostors. Their sincerity must be unquestioned. Other men learned in science, and men that have done great things for their age, were as sincerely mistaken. It must not be forgotten that Paracelsus, Kepler, Tycho Brahe, Isaac Newton, Leibnitz and others equally eminent were, at least for a time, firm believers in the principle that baser metals could be turned into gold; hence, there is no desire to characterize or condemn any one mentioned in this or any other century as being otherwise than thoroughly sincere.

The physicist considers nothing theoretically impossible, for that which is the object of derision today may be the sober, accepted, scientific fact and the valuable invention of to-morrow. The true scientist constantly holds himself in readiness to abandon his most cherished convictions and accept the latest discovery or demonstration of facts opposed to his education, experience or cherished beliefs.

It is but a few weeks ago that a professor of chemistry at the California State University at Berkeley publicly expressed his belief in the possibility of such a thing as the transmutation of baser metals into gold; and whether it be our local professor, Sir Humphrey Davy, or Hermes; whether it be Norman Lockyer experimenting on the specific heat of gaseous bodies in a high temperature, Sir William Crookes discussing "meta-elements," Cary Lea on the allotropic forms of silver, or Berthelot boldly affirming his belief in the unity of matter, it can only be said that many prominent chemists have considerable faith in the mutual convertibility of elements possessing chemical properties in common. One of the profoundest thinkers has declared his belief that: "The transmutation of an element is nothing more than the transformation of the motions which determine the existence of said element, and which gives it special properties, into the specific motions peculiar to the existence of another element."

It is neither our province nor our purpose to enter into a metaphysical discussion of the occult or esoteric. Those who look into crystal spheres, read magic mirrors, affirm telepathy, and discourse on subliminal self, are close to the slender line which divides the most of us into two classes—those that are inside and those that are outside the insane asylum. The Brothers of the Rosy Cross and the disciples of Zoroaster have always interpreted their doctrines, their head center being at present in Paris, where exists an Alchemical Association, of which S. H. Emmens, late of California, is an honorary member. They have a journal, "L'Hyperchymie," and independent groups of students. One of their oldest workers is the Grand Master, Theodore Tifferau, who in 1854 claimed to have discovered a method of transmuting silver into gold. In October, 1896, in a voluminous memoir, he claimed to have proved that the metal is an aluminum compound. This society claims that Darwin's school of evolution is but a part of the great doctrines which they teach, and which should be applied to the chemical elements as well as to human beings. Their starting point is that ether forms chemical atoms by agglomeration; that this ether is condensed energy, and that hence all matter is dissolvable into energy; that energy, matter and motion form a trinity, one in substance three in appearance; that matter is one in kind, and the diversity of chemical bodies results from differences in grouping, and in motions of the constituent particles; that ether is the father of hydrogen, which evolves oxygen, nitrogen and carbon; that this combination is due to etheric vortices; and that an alchemist who expects to succeed must possess psychic power over the atoms, so that by the action of his will the elements shall group themselves to form the metal desired.

They juggle with chemistry, and take considerable comfort in producing alleged gold at will. The following is one of their favorite recipes: "Put into a crucible layers of sheet iron and of powdered vitriol; place over it another crucible pierced with a hole for respiration. Heat in an intense fire. But a flux must be added to the crucible to prevent melting, viz: One kilo litharge, one kilo clean white sand, mix and add to the crucible at a red heat. Remove with an iron spoon the yellow oil and put it aside. The two compounds have not lost weight. This oil is dry water, a fire, a salamander. * * * You obtain a metal of a golden yellow, having a density of 24, not capable of being minted. This is changed into ordinary gold." How the final transformation is to be effected is not vouchsafed.

A candidate for entrance into this society has no easy task. He must first place himself in a properly receptive attitude by throwing out of his soul all pride, anger, jealousy, hypocrisy and idleness. This portion of the process is certainly worthy of emulation. Having reached this high plane of mental sublimity, he must practice crystal gazing, reading in magic mirrors, and be able to hypnotize himself at will. He must live in an atmosphere of perfumes and music, and finally succeed in separating his astral body from his corporeal frame. He must then learn to be discreet and silent and reveal no result; and must be possessed of sufficient money to bear all expenses of his life work. He must be up in chemistry and a little ahead of those who ordinarily practice that science by being the possessor of a magic wand, a magic mirror and a brazier; these, with an alchemist's robe embroidered in silver and gold, being among the necessary adjuncts of an adept.

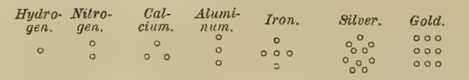
We now come to the stated results of sundry gentlemen in this country, whose works, if commensurate with their statements, will occasion serious financial revolution, and will at least render unnecessary any protracted efforts toward securing gold by the ordinary processes now known. These gentlemen claim to be able to manufacture gold. Considerable has been said and sung relative to the alleged results of Mr. Emmens' work. Mr. E. C. Brice of Chicago has also a way alleged to be satisfactory to himself of making gold; though in his odd moments he is able at will to produce silver. Of course at the present quoted rates he can put his time in to better advantage in manufacturing the former material. Mr. Brice is credited with giving out his secret as follows:

He works on antimony ore, 50 per cent antimony, 50 per cent iron, sulphur, carbon, etc. He refines the antimony, which is placed in a furnace and subjected to "destructive distillation," whatever that may be. The fumes arising from this process are driven by air blasts into a shaft six feet in diameter and 105 feet long. At the end of this shaft the fumes

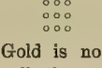
are run into wool bags, to the sides of which the antimony collects in the form of a gray colored sand, the fumes arising from the coal being allowed to escape through the meshes of the cloth. This sand is mixed with water to the consistency of modeler's clay and cut into small blocks, which are placed in a furnace and subjected to a heat approximating 5000 degrees. This is to secure as nearly as possible volcanic action. Oxygen, so Mr. Brice explains, is the medium of change. For forty-eight hours the blocks are allowed to remain in the furnace, which is patented and which Brice claims is the secret of his success, inasmuch as he has in it devised a means of securing great heat in large amounts. An ore crusher of the dry-pan kind then grinds the blocks into a gritty sand, and this is put into another furnace and covered with two portions of lead to one of the sand, which Brice calls his artificial ore. As its specific gravity is greater than that of the so-called ore the lead is precipitated to the bottom of the furnace. The intense heat causes the lead to form "litharge," which acts as a caustic on the ore and eats up nearly all its constituent elements except the gold and silver alleged to be thus produced. The lead, as mixed with the gold and silver, is base bullion. To refine the base bullion it is molded into small pigs, which are placed in bone-ash cups. Then these cups are put in a furnace and fused. Forty minutes is all the time necessary to cause the bone-ash to absorb all the impurities in the bullion, leaving a mixture of pure gold and silver. This jumble of an ordinary fire test will be amusing to any one who ever made an assay of ore.

Another gentleman, Mr. Marshall of Nebraska, disdains to fritter time away on the production of the present depreciated white metal, and devotes his time exclusively to the production of gold. Mr. Marshall has not only succeeded in producing gold, but has reasoned it all out. He thinks that the others in the same business have not caught on to the most economical process; and in a communication of some length, addressed to the editor of this paper, he gives his views in detail. Among other things Mr. Marshall says:

"For some ten years in experimenting with and perfecting my method of extraction I have all along, sometimes, that is, in some earths and ores, gotten phenomenal results, such as I detail. For instance in New York sands I got $7.50, $12, $25, $30 and $50 from the same sands just according to how they were treated. It was the same sand, and none of it would run more than a trace to $4 by ordinary fire assay. I never knew chemical analysis to get over $6 and generally a few cents. I was a trained chemist before I became a lawyer but never made any professional use of my chemical training. I studied chemistry and became quite proficient therein because I liked it. So you see I approach this matter from the view of a trained chemical expert. For a long time I entertained the chemical views, traditions and prejudices of a trained chemical expert. Had I not been bound by them I would have made more rapid progress. I refused to accept facts until forced to do so. I kept getting the gold—the extraordinary yields in some materials—not in all, not revealed by assay or even analysis. Now I find it possible to apply the principle to all ores—that is all 'dry' ores. It seems only a question of application. About three years ago I was refining or rather separating a bar of bullion from an experimental run. It contained silver, gold, copper and iridium. I separated some four ounces of gold and some sixteen ounces of silver. I had my ideas of a flux for 'saving' the gold. When I got my silver bar I tried it for gold again and found considerable gold in it. I parted again and fluxed and smelted the silver again. Still it seemed to contain just as much gold. Seven times consecutively I parted the bar and still the gold nowise disappeared. Afterward I kept on parting until I had dissipated the silver in manipulation and kept getting gold about the same yield. Then I put a silver (standard) dollar in a crucible, fluxed and melted and parted as before and got ten cents' worth of gold therefrom. Then I took C. P. silver and found the gold was 'produced.' I succeeded in applying the same principle and 'producing' gold by a similar combination from not only silver but iron, copper, aluminum and iridium as well. The latter is easily changed as there is no necessary change of gravity. It is most readily produced from alloys. Putting a little iridium into much silver will increase the yield of gold immensely and the other metals as well. These I accidentally got tangled up with a sulphide of silver in my manipulations and I got $3 worth of gold all in a bunch. So I deduced the fact that sulphur was a proper constituent. I finally succeeded in taking sulphide of silver or iron and nitrate of silver and producing a nice leaf of gold with the blowpipe. Finally I found by taking artificial sulphide of iron (this, as you may be aware, being nothing but iron filings and sulphur fused) and treating the same as a natural ore I extracted about $15 gold per ton. This can doubtless be increased to $40 or $50 per ton, as my work was defective in pulverizing, etc., when I got the $15. Here, you see, is the way by which one thing suggested another until it explains the extravagant yields of the process; so what appeared a phenomenon becomes a law, a necessity. Here is where it is most valuable. Now, a word as to the alchemists, Dr. Emmens and Mr. Brice. I know Dr. E. and have a high regard for him, and think what he claims as to production is true. As to the financial success of its production, it remains unproven as yet. I have doubts as to the profit, he only claiming 25 per cent profit; and there is expensive material and expensive work. As to Brice, I have very little confidence; he depends upon an alloy. His principle is correct, but it produces only a little gold. I have mentioned these alchemists and something of their methods. We have Dr. E. producing gold by 'force and impact' and low temperature and Brice producing by 'alloy.' I have a friend who also produces by 'alloy.' I have his formula. Another has produced a little chemically. My reaction, as you see, is strictly and only chemical. I might cite other instances of lesser note, but at least we have three different methods attaining the same end. This proves gold is not a compound, but is a condition of matter. This deduces a little hint of what an 'element' may be. There is some molecular or atomical law of crystallization or combination of which we know nothing, but which exists. It seems very evident to me, and I will illustrate what I mean. Suppose each little '°' below an atom or molecule:



"Of course, this arrangement is fanciful. We absolutely know nothing about it, but any force, gravity, electricity or chemical reaction which will cause these atoms in the different substances to rearrange and make the combination



will produce gold. Gold is not the only element I have produced. In all these reactions with metal other than silver some silver is produced. By changing the chemical combination it is very easy to produce silver from iron or aluminum. And I have in my experiments produced iron from silver, and came very near producing platinum from silver—that is, it looked like platinum, resisted acids, but somehow was lacking. I did not pursue it to conclusion. Again, I asked Dr. E. what caused him to take this course, and he answered that it was finding by working in nickel and cobalt that they seemed at a certain stage interchangeable. This was discovered from trying to produce pure cobalt and pure nickel. Here, therefore, you see, is more than a prima facie argument showing an 'element' is a certain condition of matter. Moreover, I have met several other phenomena in my experimentation. For instance, working in N. Y. sands I found by changing the electric current I had as a result no gold or silver, but from 2 to 5 lbs. of chemically pure mercury per ton. Now I never knew any analysis of N. Y. sand to show mercury. I have tried, myself, carefully and repeatedly to get the sensitive reaction of KI., making the red iodide of mercury, but could never get it. Still I have found 'traces' of metallic mercury, but nowhere near what I have produced. I washed out 14 ozs. chemically pure mercury from 500 lbs. of sand thus treated once. I found this also a convenient way to reduce low-grade mercurial ores, and of course very cheap. In the same way, by variations, I separated silver, aluminum and sulphur at will in considerable quantities. As to commercial profit I am uncertain, never having had the opportunity to pursue to a conclusion. So you see the principle of my method is entirely new, and belongs not only to gold but other metals as well.

"I have told you, taking an artificial iron sulphide containing no gold beyond, perhaps, a mere 'trace,' I produced about $15 per ton gold, with an almost certain probability of quadrupling that yield. Where do we find, so far as we can ascertain, the primary and largest source of gold? Is it not in the iron sulphide veins? True, we find gold in everything. I get it from lava, but the great and best sources are sulphides. Then am I not in exact concordance with nature? If gold can be produced from a sulphide, is it any wonder that with the chemical reactions of nature and the necessary 'force and impact' and perhaps the principle of 'alloy,' that we find gold primarily in the sulphides? Again, we frequently find veins, North Carolina being an example, where the oxydized portion will be rich, running up to $100 or more per ton, while the 'live ore,' when struck, yields only $5 to $6 per ton. Whence came this difference? I am aware miners generally have the impression that the deeper the mine the richer the ore. This is, I think, a hallucination, but in any event where it occurs it arises from fixed mineral principally and not the necessary rule of increase of value. In other words, exposure to the atmosphere, I would demonstrate to you under proper conditions, increases the yield of gold. I found a ledge in New Mexico where the outside for a few inches ran $20 to $30, while inside it decreased to a 'trace.' Upon somewhat the same principle depends both my success and Dr. Emmens'. As to Brice I know not. Just to-day comes a great story of Brice's success. It may be so. I understand the principle to a degree, but its financial success I cannot conceive of. Thus you have the whole principle. In the printed statement you have the results. I have now briefly recounted how I was led up to these results."

Mr. Marshall's article may, if nothing else, add something to the gayety of the mining world. He kindly points out toward the close the illusion which he believes miners labor under, of thinking that the deeper the mine the richer the ore. Upon reading Mr. Marshall's remarks those miners who harbor that belief will see how badly mistaken they have been all along; and likewise will note the valuable addition to the general information on mining subjects that Mr. Marshall vouchsafes, wherein a ledge in New Mexico of "outside" ore ran $20 to $30, while "inside" it petered out. It is probable that Mr. Marshall ran up against a ledge where the surface was free milling ore, sulphurets developing as depth was attained—which is not an uncommon phenomenon the world over. His alleged ability to produce fourteen ounces chemically pure mercury from 500 pounds N. Y. sands is also of lessened value when it is taken into account that it is not probable such extraordinary attribute is shared by the sands of this coast, though probably were Mr. M. to experiment with Carson river sands below the old Comstock dumps he might find even more than the same proportionate amount of mercury therein. The letter is published merely to illustrate the mode of thought, the absurd and fanciful claims of the writer and the evident fact that he himself believes in the truth of all he says, which is a characteristic in all ages of devotees at any shrine. Of course, it is difficult to imagine how any one outside of the incurable ward of an insane asylum could expect to get $15 in gold per ton out of "iron filings and sulphur fused," but such things are essential articles of faith in the creed of orthodox modern alchemists.

MANUFACTURERS of mining machinery who contemplate increasing their business anywhere in this west half of America would do well to remember that the time to advertise in the MINING AND SCIENTIFIC PRESS is when you want more business. In this regard it is in order to state that it is not the amount of money you spend in advertising, but it is the amount of advertising you buy for your money that tells. You need to be a judge of advertising, its qualities and values, and be able to buy it right, just the same as any other line of goods you buy. It pays advertisers to make announcement in our advertising columns. That is the reason we bring it to advertisers' attention. It pays you. If it didn't pay you, it wouldn't pay us to have you use it. But it does pay. A good advertisement in a good paper is worth more than a poor advertisement in forty poor papers. There are other mining journals, but it is generally conceded that the MINING AND SCIENTIFIC PRESS is the best and gives advertisers the greatest value for the money expended with it.

Hydraulic Mining.*

NUMBER II.

While, for the reasons stated, the flume should, as a rule, be avoided, conditions are sometimes such as to render recourse to the structure expedient, and that independent of topographical reasons, as for instance, where there is much rock to be excavated; where the ground is broken and porous, or water is so scarce that evaporation and absorption should be reduced to a minimum. Where a large amount of lumber is required for flume building, including supporting trestles, it may be economical for the company to manufacture this material instead of buying it, to which end a cheap sawmill should be put up at or near the head of the ditch, and, as the latter is finished and filled with water, float the lumber down to points where wanted. Almost always there is in California, at the head of these ditches, and generally for a long way farther down, timber suitable for making good lumber. A sawmill erected, lumber could be made not only for the flumes and trestles, but for all other purposes connected with the mining, the cutting of sluice boxes included.

In general terms, it may be said that as much grade should be given the flume as practicable, since the greater the fall the smaller the structure required to carry a certain amount of water. The material used in the construction of a flume must be proportioned to the size and duty required of it, much being left to be determined by the judgment of the builder. Usually posts, sills and caps, made from 3x4-inch scantling with 4x6-inch stringers, will suffice for a flume 2½ feet square—timbers, larger or smaller, being employed in proportion to the dimensions of the flume, the posts, sills and caps being set 2½ to 3 feet apart. For lining, well-seasoned, first-class 1½-inch boards should be used, the seams being covered with pine battens 3½ inches wide and ½ inch thick. An open space of a few inches is usually left between the upper edge of the planking and the cap. The posts should be let into the ends of the sills and caps to the depth of an inch and a half, but not mortised or tenoned. If thought necessary to strengthen the flume, the sill may be extended a foot or two beyond the post and side braces be nailed thereto. On the cap pieces a plank is placed to facilitate foot travel along the flume.

Where the latter rests on a trestle or scaffolding, the supporting posts and sleepers of these structures should be well charred to prevent their decay. High trestles should be anchored with strong wires or wire rope as a protection against the force of the wind. It is well to keep always some water flowing through the flume, as the swelling of the planks incidental to the change from a moist to a dry condition tends to induce leakage and draws the nails. As with ditches, waste gates ought to be placed at suitable intervals along the flume, that it may readily be emptied should occasion require. Where exposed to snow-slides, it is customary to make an open cut in the mountain side, and, having placed the flume in the excavation, cover it with a shed composed of heavy timbers roofed over with planks or logging.

When, as often happens in excessively cold weather, there is danger of the water flow in the flume or ditch becoming obstructed by the formation of anchor ice—that is, ice forming on the bottom—the water should at once be turned out or the ice may accumulate to such an extent as to fill the channel solidly and so remain till thawed out by the return of warm weather.

When in building a flume a curve becomes necessary, the outer side of the structure must be raised to an extent corresponding with the abruptness of the deflection. This arrangement, by throwing the accumulated water to the opposite side, tends to equalize the flow over all parts of the flume. When this occurs, the boxes or sections of the flume, usually 12 feet long, have to be shortened, the posts, sills and caps at the same time being set closer together. For the more readily effecting this curve, the side planks are on their face cut with a saw, the bending of the plank closing these cuts tightly.

For the construction of a box or 12-foot section of a flume 2½ feet square, 261 feet of lumber, board measure, are required, being at the rate of 106,100 feet per mile. For a flume 4 feet wide, 3 feet deep and one mile long 241,560 feet of lumber are required, while for one of these structures 7 feet wide and 4 feet deep of equal length 303,160 feet of lumber would be called for.

Iron Pipes.—Among the obstacles encountered in the conveyance of water to points where required for consumption or use are elevations above and again depressions below the common ditch level. For surmounting the former, recourse to iron pipes may be had if sufficient head to force the water over the obstruction can be obtained without going up the ditch too far, thereby necessitating the employment of an objectionable length of pipe. So, too, the elevation may be pierced with a tunnel if here again the cost of the adit is not so great as to make its construction impracticable. There being no other alternative, resort to one or the other of these expedients must be bad, if either be feasible—a point to be determined by the preliminary survey—or else the projected enterprise must be abandoned.

Where the trouble to be overcome consists of a depression of the surface so deep as to preclude recourse to fluming, then the iron pipe in the form of an inverted siphon must be employed, where the conditions make this practicable.

A remarkable feat of this kind was achieved by the Spring Valley Canal Company, who, for the purpose of conveying 1500 inches of water carried by their ditch across a deep canyon in Butte county, laid down a 30-inch iron pipe extending from one side of the gorge to the other, a distance of 14,000 feet, the point where the water enters this pipe being 980 feet above the bottom of the canyon and 150 feet above the point where it makes its escape. The water here entering the pipe, therefore, had a "head" or hydraulic pressure of 150 feet, yet at this end of the pipe it never attained a height of more than 50 feet above the point of discharge, at the opposite end, a fact denoting that a much smaller pipe than that laid down by this company would have sufficed for the above service. This pipe under the pressure mentioned discharged 53 cubic feet of water per second.

Another notable enterprise of this kind has just been completed this month (Dec., '97) at Junction City, Trinity Co., where a French company put in 5700 feet of siphon passing over a 280-foot canyon. Of this, 2200 feet is No. 10 iron 30 inches in diameter and 3400 feet is 36-inch pipe. The laying of this huge pipe required considerable engineering skill. The whole thing is illustrated and described in the issue of Nov. 27, '97.

Where leakages occur in the slip joints of iron pipes, these, if slight, can be stopped by throwing in a bag of sawdust, or, if somewhat large, by driving in soft, well-seasoned wedges of pine, which, swelling, make a very close joint. If the leak be extensive, recourse must be had to iron grip-bands, clamped on and drawn together with screws or wedges.

(To be Continued.)

MINERS BOATING DOWN THE YUKON.

On the Yukon River and at Fort Yukon.

Accompanying the party which left San Francisco July 28th. '97, on the Portland, en route for Dawson City, N. W. T., was Max Newberry, special artist for the N. Y. *Herald*. Herewith are reproduced two of his sketches, one of two miners journeying down the Yukon. The two portrayed went in by way of Skaguay over the Chilcoot pass, thence to the chain of lakes and across by boat to the Hootalinqua, thence down the river 400 miles to the Klondike.

The other picture portrays an overland scene, a party of Klondikers arriving at Fort Yukon. The dogs are preceded by a man on snowshoes, who makes a trail in which the animals walk. Dogs will not pull a sled unless they have a trail. They are kept in line by another man in front of the sled, who steers by means of a geestick. This man also does a good part of the pulling.

KLONDIKERS ARRIVING AT FORT YUKON.

Notes on Present Western Practice of Metallurgy Economically Considered.

NUMBER II.

By W. B. DEVEREUX.*

In both custom and mine smelting works the first requisite is a sampling works of sufficient capacity. In order to accomplish good work it is absolutely necessary to know not only the value in precious metals of the ore which is to be treated, but also to have a complete analysis of its earthy or non-valuable constituents. Of course, in a private smelting works the only object in running the ore through the sampler is to determine its value and slag constituents. It is of the utmost importance that accurate and full details in regard to the ore be kept in books arranged for that purpose. In no other way can the metallurgist check the work that he is doing in his smelters, and in no other way can he so make up his ore mixtures as to obtain uniform slags. The ordinary form of book will show the ounces of silver and gold; the percentages of lead and copper, and, in additional columns, the silica, iron, lime, magnesia, baryta, alumina and zinc. The works should be charged with a total of the valuable constituents, even though the quantities are so small in some ores that they are not paid for, as is the case sometimes with small percentages of lead, copper, silver and gold. They are also credited with the amounts of valuable metals obtained, and, at convenient times, a balance is struck and the percentage of values saved is determined, proper allowances being made for values in by-products, fine dust and in furnaces.

Lead and silver smelting less than twenty years ago was a very simple process as compared with the same process at the present time. Smelting was then carried on chiefly with surface ores already oxidized by natural causes and containing no deleterious ingredients. The furnaces were small, slags were easily made, and the smoke and dust were allowed to escape into the air. Very little matte was made, and large percentages of lead were used in the charge. At the present time the easily smelted surface deposits have been exhausted to a large extent; the ores have become complex and carry sulphur; lead ores have become scarce and in great demand, and the percentage of lead used to collect the precious metals has steadily decreased. The presence of sulphide ores also necessitates roasting furnaces. Large quantities of matte are made, and the treatment of this matte has itself become complex, because nearly all of the custom ores carry small quantities of copper which ultimately finds its way into the matte. This has brought about the introduction of copper-metallurgy into lead-silver plants, and there are scarcely any custom works of this character in the West which do not have appliances devoted to the metallurgy of copper. The great impetus to lead-silver smelting came with the discovery of the carbonate ores in Leadville. The first smelters used there were small round water-jackets. With the need for a greater capacity came the introduction of the rectangular furnace, the width being kept about the same and the greater capacity being obtained by increasing the length. There has been a constant effort to get more capacity, and at the present time metallurgists are still striving to build a furnace which will give a greater capacity than those at present in use. It has been found, however, that there are limits to the breadth of the furnace, which is the distance between the tuyeres, and also to the blast pressure. Furnaces have been constructed which exceed the present types in both these conditions, but the results have been such as to fix the breadth for the present at about 42 inches and the blast at 32 ounces maximum. The general type of furnace now constructed has an inside dimension at the tuyeres of 42 by 120 inches. Furnaces 42 by 140 inches are running satisfactorily, and others are being constructed of the same dimensions. The ordinary practice is to make the height 16 to 17 feet from tuyeres, to top of charge. This is an advance of about 4 feet over the height of charge, which is still in use at many of the works, and is necessitated by the increase of blast pressure now used. Some new furnaces are now being made with a height of 20 feet. Sixteen ounces is almost a minimum blast pressure now, and from 26 to 32 ounces is common. Three types of rotary blowers are in use, and these are constructed so that pressure even higher than 32 ounces can be maintained, if desired. Fan blowers are not used by Western smelters.

The increase in dimensions has, however, necessitated more massive construction, owing to the larger amount of material the furnace is to contain. The foundations are of the best. The wrought-iron plate which forms the bottom of the iron enclosure for the crucible must be absolutely tight and rest solidly upon the foundation, preferably upon a layer of cement. Let me caution you here against using cast iron plates for the under part of the furnace, as a slight crack will admit of the passage of melted bullion down into the foundation. I have known cases where tons of bullion have found their way into the foundation of the furnace through a hole not larger than a nail hole, and when the furnace was taken down it necessitated the excavation through the foundation and down into the clay below for 8 or 9 feet, before the last of the bullion was recovered. Crucibles should be made of good firebrick, well luted together, so as to prevent as little absorption of bullion as possible. Generally the jackets rise to the height of the bosh only. Above this the furnace is constructed of brick. Some metallurgists have advocated the construction of the whole furnace of water-jackets. The only real advantage in this is the fact that zinc and other accretions forming on the sides of the furnaces can be much more easily barred off from iron than from brick walls. On the other hand is the liability of injuring the jackets in barring down, the necessity for increased water supply, and the regulation and care of the additional jackets.

Water-jackets are used exclusively for the lower part of the furnace. These are made both of wrought iron and of cast iron. Wrought iron jackets are generally made so that a single jacket forms one side of the furnace, while cast iron jackets are made in sections. Both constructions have advantages. In case of a leak a single cast iron jacket can be taken out and a new one put in very quickly, without blowing out the furnace. The disadvantage of cast iron is its liability to crack. This objection, however, has been overcome to a large extent by making the castings very carefully, so that the thickness of metal is uniform throughout, and changing the form of lugs by which the castings are bolted together, so that the strains will not break these off; consequently the use of cast iron jackets has been increasing in the last few years. In some works cast iron jackets have always been used to the exclusion of wrought iron. The advantages of wrought iron jackets are that there is no possibility of cracking, that the whole side of the furnace can be formed of one jacket, and the life of the jacket, if properly cared for, is much longer than that of the cast iron. If the water becomes low in the jacket and the iron becomes overheated, the sudden introduction of cold water will not cause a crack, and damages to the jacket can be repaired to a very considerable extent by patching on the inside. Very long jackets, however, become very much warped through the difference in the expansion of the inside sheet and the outside sheet, and a very decided bow in the center is established, thus disarranging the interior shape of the lower part of the furnace. Of course, if the furnaces are built in inaccessible places, where it is difficult to replace jackets, one would naturally chose wrought iron in place of cast iron; but where foundries are available cast iron is generally preferable, as a few extra jackets on hand will obviate the trouble which might come from a single jacket breaking down. The old style of jacket, and one which is still in use to a large extent, has for the admission of air a hole cast in the side of the jacket in which is inserted a galvanized iron tuyere pipe. At best the nozzles do not make a very close fit, and when they have been knocked around by the furnace men a few times it is impossible to make them air-tight. Melted slag also damages them to a greater or less extent. When it is desirable to lessen the pressure of blast or cut it off altogether on a particular tuyere, in order to allow the other tuyeres to melt away the slag obstructions, it can only be done by tying the sack so as to close it partly, or by taking out the pipe and blocking the tuyere opening. Of course, in well regulated furnaces running under proper conditions, these things are very seldom required, but at the same time it adds very much to the convenience of the furnace to be able to do them without trouble when they are necessary. If it is easy for a workman to make any such temporary changes he will be more apt to do them promptly. This had led to the introduction of a number of tuyere connections which supply such conditions to a greater or less degree. The general form of these is a cast iron box or pipe which is flanged and bolted by lug bolts to the side of the furnace, so that by loosening two bolts it can be lifted off.

The tuyere box is attached to the main air pipe by a canvas pipe or by a rigid iron connection. Personally I prefer the latter. The tuyere box is also provided with a valve either in front of the tuyere opening or in the upper part. Some forms have valves similar to a clack valve with two openings, one of which opens into outer atmosphere and is closed by the pressure of the air holding the valve up against the opening. In case the pressure is stopped suddenly the valve drops and closes the opening into the air pipe and falls away from the opening into the air. This is for the purpose of allowing the gas which always comes back into the air pipes when the blast is stopped to pass into the outer air, and thus prevent the possibility of explosions, which are sometimes very serious unless proper precautions are taken. Another form of tuyere consists of one box carried around the furnace either in front of the tuyeres or above them and connected to the tuyere openings by close-fitting connections. In many works to-day the whistle of escaping gas can be heard in many places, and I have no doubt that the leakage from these sources, if measured, would astonish many metallurgists who consider their works are running very satisfactorily. It certainly needs but little argument to show that constant leaks, through which air is blowing at about two pounds pressure, must use up in the aggregate a very considerable amount of power. Power costs money, and its loss through mechanical defects in construction is inexcusable.

Furnaces of the type I have described will smelt from 60 to 100 tons a day, according to the character of the charge, together with the addition of a certain quantity of rich slags. These are added to recover their valuable contents, and also to make coarse material in the furnace, which helps to keep the fine ore from packing and scaffolding, and forms interstices for the passage of the blast. It also performs another function which is not so well understood. By this I mean that another slag cannot be melted without a considerable amount of fuel by itself, yet it is universally found that given a charge of ore, running with the least possible fuel, a very considerable amount of slag can be added to the charge without necessitating any increase of fuel. The probability is that the slag, being already proportioned and having been liquid, melts first and acts as a carrier for the unfused slag-forming material in the charge. In other words, it becomes first, let us say, more siliceous, in which form it is very corrosive as regards the bases in the ore, and combines with them when it again has a great attraction for silica. With a furnace of this class running under ordinary conditions, a number of products will be obtained, the disposal of which is a matter for careful consideration. By far the largest product is, of course, the slag. In the earlier smelting practice in this country the slag was tapped directly from the furnace into slag pots, which iron were wheeled to the edge of the dump and the slag immediately emptied out. It was found, however, that in tapping directly from the furnace a certain amount of metal was carried out in the current of the slag, and, in addition, when ores were smelted which contained sulphides, a certain amount of matte was formed which was also tapped out with the slag. When no matte was present, the metal tapped out with the slag could generally be saved, to a large extent, by pouring out the liquid slag and saving the partially cooled shell adhering to the sides of the pot. As soon as the matte became a factor in smelting, it was necessary to allow the slag to cool in the pots, and afterward the button of matte found at the bottom of the cone of slag was broken off and saved for subsequent treatment. This, however, rendered it impossible to save the shells, which were found to be of considerable richness, as the partially cooled slag on the sides of the pot prevented the small globules of matte and metal from settling. The next step consisted of having pots with a hole bored in the side above the height to which the matte ordinarily extended, and, after the slag had sufficiently settled, it was tapped out through this hole, leaving the rich shell on the sides of the pot and the matte in the bottom. This process is used in many works to-day, but it has the disadvantage of making more shells ordinarily than are required as flux for the ore charge. Besides, it entails considerable labor in separating the matte, which is more or less mixed with the slag, and not in as good condition for retreatment. The most feasible way to separate the matte and make clean slugs is by using a forehearth, and this device is now coming into extensive use in lead smelting. With the small furnaces formerly in use, the forehearth was hard to manage, as it gradually crusted up, owing to the lack of sufficient hot slag to keep it heated up to the melting point. With the introduction of larger furnaces, especially those of 80 to 100 tons capacity, it has been found practicable to use forehearths, which collect the matte and from which the settled slag overflows into pots.

(To be Continued.)

* Condensed from School of Mines Quarterly.

A PAPER on experiments in boiler bracing, by Mr. Francis J. Cole, read before the American Society of Mechanical Engineers, showed that the average holding power of stay bolts, when screwed through three-eighths plate and riveted over, when cold, is 16,350 pounds for the worst, and 24,000 pounds for the best, and, when hot, 3470 pounds for the worst and 4613 pounds for the best. This indicates that the best riveted head which can be formed cold, made in the usual conical shape, has a holding power, hot and cold, very much less than the worst form of bolt and solid head, even when nicked or grooved deeply under the head, or bolt-screwed through with a nut on under side of sheet. It does not appear that the solid bottom head-bolts are deficient in holding power when used in this manner, but the principal objection to their use is their liability to injury when screwed into a firebox where the holes are not tapped at right angles to the sheet and where the surface of the sheet is curved.

THE projected tunnel under the Irish Channel to connect Great Britain with the north of Ireland, will be about thirteen miles in length. It will reach from the Mull of Cantire to Tor Point, in county Antrim. The estimated cost is $35,000,000. The Hungarian government has just completed the necessary arrangements for the construction of a tunnel under the Danube at Budapest. There is to be a foot path for passengers and an electric railway, also an upper way, which will be reserved exclusively for vehicles. It will be ventilated by electric machinery.

Mining Summary.

CALIFORNIA.

Amador.

The lowest workings in the Keystone, at Amador City, are 1600 feet on the incline. The vein can be worked to the depth of 3000 feet, and the mine is not half worked out. The mill is running on ore from the upper levels.

Leader: The Jackson M. & M. Co. has bought from J. A. Greenwood the Townsite mine No. 2.

The shaft in the Amador Queen No. 1 has passed the 800 foot mark and Gen. Mgr. Dye is making every effort to get to 1000 feet.

The new shaft of the Wildman at Sutter Creek was started two weeks ago. Mr. Ross hopes to get the shaft down 100 feet per month. It is to be three-compartment.

At the South Paloma, Supt. M. B. Kerr is having the ground between the 700 and 1200 levels prospected.

The Amelia shaft is down 345 feet and progressing favorably.

At the Greek mine, near Esperanza, a rich strike is reported. The mine is bonded to San Francisco people, who have put up a small mill. The shaft is down 130 feet, and the vein is from 2 to 3 feet wide.

Ten tons from the Hirschle Ranch mine netted $22 per ton in free gold. The vein is from 30 to 38 inches.

Butte.

The Butte County M. & P. Co. at Nimshew is locally reported to be in financial troubles and its mine closed in consequence of attachments.

Calaveras.

(Special Correspondence).—The Paragon, Mountain View, Palomacita, Princess, Tip Top, Bullion and Empress quartz mines have been consolidated under the name Paragon Con. G. Mines. They are located near West Point. There are seven parallel ledges, from 2 to 10 feet in width, and worked through tunnels at depths varying from 250 to 400 feet, with a 10-stamp mill, electric lighting plant, and water power under a pressure of 410 feet. This property is under the management of Percy L. Shuman, one of the owners.

The Amador *Dispatch* says that a mining deal has taken place covering properties near Mokelumne Hill. Mr. Shuman, who owned the North Star mine, has associated with him a Chicago man and secured ground covering a distance of 2¼ miles in length and from half a mile to 1½ miles wide. The new company is known as the North Star Con. The channel is 200 feet wide the entire length of the property, with pay gravel 13 feet in depth, estimated at $1 50 to the ton. The motive power will be electricity, taking water from the Mokelumne and Campo Seco ditch.

At the Amador Queen No. 1 Supt. J. E. Dye has arranged to put in power drills, and will begin operations on an enlarged scale.

A good showing has been encountered in the Paragon group near West Point, owned by Mr. Shuman of Mokelumne Hill.

The Spanish Bar on the Mokelumne river will be worked on the hydraulic-lift plan. The mine has been bonded by W. F. Robinson to a German company in San Francisco.

El Dorado.

W. D. and M. English of Oakland are doing assessment work on the Van mine, near Georgetown.

Fowler and Benson purchased a one-quarter interest in the Marshall quartz claim, below Grizzly Flat. In running a 500-foot tunnel they struck a ledge 7 feet wide of promising ore. It is free milling, and from six tons they realized $58.

Gazette: J. A. Elder, at Pilot Hill, is making preparations to erect a 20-stamp mill on his quartz mine.

Democrat: J. Mott has begun work on the Gardner mine, near Fairplay.

The mines in operation near Fairplay are the Old Confederate, the Petaluma and the Uncle Sam—all gravel mines.

The shaft on the Gamblin is down 50 feet and the rock looks well.

The mills of the Union, Pocahontas and Buena Vista mines, near El Dorado, are all in operation, and the Starlight will begin crushing Jan. 1st.

The new mill at the Esperanza, near Garden Valley, is running full blast. About forty men are employed.

Inyo.

The shaft on the Molus, near Bishop, is in 200 feet, and drift 130 feet. The ore averages $30.

Kern.

The opening of the new 10-stamp mill at Johannesburg and the opening of the railroad to that place liven matters.

Miner: On the Pinmore, at Randsburg, twenty men are working, the production amounting to a ton per day to the man. The total development to date on this property is 750 feet of tunnels and drifts.

A ledge of rock running from $60 to $75 per ton was uncovered on the Tip Top last week. The ledge is 2½ feet and two men took out twelve sacks.

Mariposa.

(Special Correspondence).—The event of the past week in mining circles has been the cutting of the Crown Lead ledge in the tunnels of the Red Banks property. The Crown Lead mines are on the mother lode about six miles southeast from Coulterville and with the Red Banks properties occupy the north side of the Merced river, opposite and adjoining the Mariposa Grant. Both properties are under bond to the London Exploration Co. for a price said to be $225,000 and the crosscut tunnels of the Red Banks have been extended to cut the Crown Lead vein, which lies parallel with the former and to the northeast. At a distance of something over 900 feet from the mouth of the tunnel this vein has been cut, showing over 30 feet of pay ore, all of which is reported to assay over $10 per ton and much of it will go many times that amount. The tunnel is about 100 feet above the Merced river and cuts the vein at a vertical depth of about 1000 feet below the outcrop. So far as known this is the most extensive strike made on the southern part of the mother lode in several years and is thought to insure the opening up of these properties, and incidentally of course the Mariposa Grant, which, however, is now become of secondary importance in the transaction.

At the Merced properties about fifteen men have been laid off on account of the completion of the air compressor plant at the Mary Harrison, and power drills will now be used in the stopes. The two men recently arrested at Coulterville for stealing ore from this mine were bound over for trial in the Superior Court. The rock found in their possession was positively identified by the officers of the company, who testified that they had mined quartz in California for twelve months and knew that there was no similar rock within miles of their property. The manager testified that the streak of rock alleged to have been stolen was worth $10,000 per ton. This is partly corroborated by the fact that the monthly cleanup just made is the largest in the history of the mine and shows a handsome profit. Well-informed people claim to see in the recent announcement that "inside friends" would advance this company the sum of $60,000 for further development, the first step towards wiping out the present excessive capitalization of Merced. They point out that another of the Bigelows was recently reorganized through the same process of loans from friends, foreclosure and receivership, and that its new $10 shares are selling at $25. That while the only one of the Merced properties remaining in operation—the Mary Harrison—is a good mine, improving with depth and turning out a constantly increasing margin over its cost of operation, yet it can never hope to pay a satisfactory return on the present investment, which amounts to $1,200,000 over and above the entire output of the mill to date, and the only prospect of getting the property on a dividend-paying basis is through a reorganization for a reasonable sum.

At the Virginia the storage dam is completed and the frame of the new mill is in place, and most of the machinery is on the ground.

A local pool has been formed in Coulterville to explore the Black Bart mine at Curry's Flat, from which large pockets have been taken in the past.

Representation work is about completed here and compliance with the law has been more general this year than usual, owing in part to the increased confidence now felt in Mariposa mines and also in part to the requirement in the new location law of $50 work immediately on location of the claim.

Bear Valley, Cal., Dec. 20th, '97.

Nevada.

The tunnel on the Benton & Murchie gravel mine is 210 feet, and a contract has been let for 200 additional feet.

The Phœnix M. Co. paid the final installment on the Sneath & Clay, on Gold Flat. Mgr. Shockley is making headway in completing improvements.

The Red Dog M. Co., in trying for a permit to build a dam in Greenhorn creek for restraining debris, met with opposition at the meeting of the commissioners, W. T. Phipps appearing for the Anti-Debris Association.

Telegraph: Rich ore has been coming from the 900 drift of the Brunswick. The ledge at that point is about 18 inches and is said to be as rich as the ore that came from the Delbi.

The Grass Valley district reports 40 stamps dropping at the North Star, 40 at the Empire, 25 at the Maryland (Idaho), 28 at the Omaha, 20 at the W. Y. O. D. (Work Your Own Diggings), Brunswick 10, Crown Point 10, Pittsburgh 10, Penna 5, Orleans 5, Gold Flat 5, Custom Mill 15. In the Nevada City district are reported 70 stamps at work at the Champion, 40 at the Providence, Nevada City 20, Murchie 20, Mountaineer 20, Mayflower 10, East Harmony 5, Delaware 5, Stanford 5, Old Home 5, Reward 1, Custom Mill 10.

The shaft at the Live Oak is 100 feet, and drifting has begun.

Development work continues at the Ormonde, Washington.

Herald: A rich strike was made in the Brunswick, Grass Valley, last Saturday.

add calavras

Echo: Work in the Ghost mines, located on the mother lode, is progressing.

A shaft is being sunk on the Calaveras Con at Robinson's Ferry.

Citizen: J. S. Lloyd, at Sheepranch, has discovered an iron mine on his property.

Transcript: Prospecting at the Stanford under the superintendency of Joseph Thomas is satisfactory. The ledge is improving in both drifts. The shaft will be run another 100 feet.

A new pay chute has been struck in the Chapman Ranch mine.

Placer.

Boston—The statement of the Pioneer M. Co. for November compares as follows with previous months:

	Nov.	*Oct.*	*Sept.*
Tons rock crushed	530	508	610
Value of gold bars	$8 367	$9,337	$11,858
Payroll	4,421	4,636	4,441
Bi ls	1,717	1,642	1,271
Total expenses	6,138	6,378	5,712
Net earnings	2,228	3 158	6,146
Average value of rock	15.79	18 38	19.44
Men employed	56	57	56

Sentinel: The Schultz mine near Westville has a tunnel on the ledge 250 feet, and a 2-stamp mill.

At Sunny South twenty-five men are at work.

J. Q. Ackerman is the new Supt. at the Sailor Consolidated, fourteen miles above Westville.

At the Bald Mountain Gravel mine above Westville, the channel is worked through a shaft of 100 feet. Operations will be continued during the winter.

The ledge at the Drummond has been encountered in the new tunnel at a distance of 1213 feet, 750 feet from the surface. A crosscut shows the ledge to be 14 feet between the walls. The Drummond is eight miles northwest of Forest Hill. C. L. Lang is Supt.

Five men are engaged at the African Gravel mine on the American river, three miles from Applegate. M Merrithew is Supt. A shaft has been sunk 54 feet and drifting commenced.

In Placer county Schultz & Warner are operating a property on which they have a 2-stamp mill. The men take out the ore and Mrs. Warner runs the mill.

One hundred ounces of bull on, estimated at $12 an ounce, were shipped from the Boulder, near Ophir, last week.

The new tunnel on the Drummond cut a 14-foot ledge 750 feet below the surface.

A few years ago W. C. Ralston and associates located several thousand acres of ground on the Ralston Divide. The claims were worked as one property, covering eight miles of the channel. A French company, through Mr. Ralston's efforts, took hold of the property, and in April, 1895, they began preliminary work, expending about $1000 per month. Work was partly suspended on Aug. 1st, '97, and resumed Dec. 1st, '97, and will be continued until the property is thoroughly developed.

The Bear River Hydraulic M. Co., near Colfax, has been operating three weeks. The object is to prospect only, and for this purpose 400 inches of water are used, by which it is estimated to move from 1500 to 2000 cubic yards per day.

Remembering the prodigal waste in early hydraulic mining, when 50 per cent from the mines of Dutch Flat, You Bet, Little York, Gold Run, etc., were dumped into the basin of Bear river, anything but a good and uniform prospect in this vast gravel bed would be a disappointment. The Erie M. Co. own the lower half-mile of this gravel bed, with ground below and right-of-way from the South Yuba Water Co., whereby the entire deposit of gravel in Bear river may be readily converted into a big sluicing proposition, which, in fact, it is.

W. Nicholson, Supt. of the Hobart mine, says the ledge in the Hobart compares favorably with the mother lode.

The tunnel on the Haub mine is 1200 feet in bedrock under the channel, and, by a little upraising, shoots the gravel to the main entry. It is said they are taking out an ounce a day to each man.

The tunnel on the Cedar Creek mine is 1300 feet on bedrock, and delivers the gravel by upraising chutes. A. Rogers is Supt.

Plumas.

The Claybank tunnel is being pushed rapidly.

Bulletin: A. G. Cameron is retimbering his drift mine on the North Fork. The pay streak ranges from 40 to 90 feet in width and is from 5 to 7 deep.

H. Kelley is running a tunnel in the San Jose. After 50 feet he will make an upraise to the channel.

Dunn Bros. are erecting a quartz mill near the Wentworth claim.

D. White and son are working their river bar claim.

Sacramento.

Mining locations have been filed this week on the American river channel.

San Diego.

In the Julian and Banner districts several good strikes are reported and there are more men at work there now than for years. The Helvetia mine, near Julian, is being drained of water, that it may be examined. Enough ore is being taken out to pay expenses.

Receiver Pauly of the Free Gold mines at Hedges states that the reported rich discovery by Peter Burke, on the desert between Hedges and Ogilby, is not true. There is no find of dirt running 50 cents to the pan, or any other amount, according to Mr. Pauly. Receiver Pauly warns people that they will find nothing to repay them for their trip to the desert.

San Francisco.

The State Supreme Court in the case of Ball, respondent, G. R. Tolman et al., appellants, has affirmed the judgment of the lower court, that the act of April 23, 1880, "amendatory of an act for the better protection of the stockholders in corporations formed under the laws of the State of California for the purpose of carrying on and conducting the business of mining, approved March 30, 1874," applies to all corporations formed for the purpose of carrying on and conducting the business of mining. It applies not only to corporations which extract gold and silver from ores, but equally to those which extract it by the methods of placer or hydraulic mining. Under possible circumstances the directors of a corporation, when they have failed to comply strictly with the law, may be held excused; but if so, the facts must be within the knowledge of the directors who are sued and should be set forth and proved. Where there has been an entire failure to comply with the law mere ignorance of the law constitutes no exculpation.

Shasta.

An employe of the Iron Mountain Co. writes they have enough metal in sight to last 20 years, and that about 1100 men are employed around the mine, quarry and smelters. Miners' wages at the mine are $2 60 per day—board 50 cents. The foreman says that there are at least 125 men per week applying for work and refused, which sounds somewhat exaggerated.

Free Press: McLeod & Johnson have a crosscut tunnel 120 feet. The ore body is 60 feet in width and averages $5 per ton.

E. P. Connor and son have done considerable development work on several locations. The Jumbo yielded $6000 in one season. A drift has been run on the ledge 40 feet.

Extensive work has been done on the Corinne. The ledge is 2 feet and the ore averages $15 per ton. A crosscut tunnel is in 150 feet.

A shaft on the Phœnix shows the ledge to be 2½ feet. The ore mills $10 per ton.

On the Bonanza the shaft is down 35 feet on a 4-foot ledge. A stratum on the foot wall of the vein gave a return of $3600 per ton. A drift 70 feet showed a small vein of sulphuretic ore and a drift 50 feet shows a ledge of the same kind of ore 2 feet in width.

Hussey, Fisher & Co., on the Alice, near Keswick, have one tunnel 150 feet and another 100 feet, exposing a ledge which runs from $15 to $125 per ton.

The Union, near Redding, is sinking on a gravel channel. They recently put down a 50-foot shaft.

The Afterthought smelter was started last week, after an idleness of a year. The plant has a capacity of thirty tons per day. They have about 1200 tons of roasted ore on hand.

Siskiyou.

Sovey & Clute are working the Kelley diggings on Cherry creek.

W. W. Walters and others are opening a new mining region near Gottville.

Spengler Bros., at the mouth of Humbug, will commence sluicing about Jan. 1st.

The miners near the junction of Shasta and Klamath rivers begin operations Jan. 15th.

The yield of the Blue Gravel mine at Greenhorn last month amounted to $7000. This blue gravel bed extends from Yreka creek up the Greenhorn creek channel 100 feet in depth.

The slab to be used as an invitation to the President for the Golden Jubilee in San Francisco was taken from Major Meyers' quartz ledge in Quartz valley.

Eastlick and Kradle are opening the old Carson mine near Fort Jones.

D. Manning's crosscut tunnel at Oro Fino has reached 140 feet.

Some high-grade ore is being taken from the Quinne mine in Cherry Creek district. The tunnel is being run on the vein 500 feet below the surface.

The Boggs hydraulic mine on Elliott creek was sold last week to Portland people.

Jas. Ironsides has taken $1200 from a seam less than 2 inches wide from the Little Chief.

Journal: H H. Hunter of Yreka is sinking a shaft on the Queen mine at Cherry creek. The ledge is 16 inches wide.

The Garrett, opposite Hamburgh Bar, is still in operation on good pay ground.

The Distlehorst-Barton dredger is at the lower end of Collin's field, in the Klamath, and taking out good pay.

Trinity.

Mining is reported active along the Trinity river. The La Grange started last week. The Red Hill is also working.

Journal: The Lappin Co. near Deadwood has 700 feet of tunnels, levels and shafts. The rock is of uniform grade. As soon as the mine is opened, a stamp mill will be erected. There are nine claims. The owners are M. A. Brady, R. E. Cochran and J. Tourtellotte of Weaverville.

R. H. Clifton of San Francisco made four cinnabar locations in the Hyampom section. The ledge outcrops 4000 feet. He will open the ledge.

Tuolumne.

(Special Correspondence).—On the Philadelphia mine, owned by the Goldwin M. Co., an Eastern organization, a rich ore body was encountered last week at a depth of 400 feet. The tunnel is 496 feet, encountering a 3-foot ledge at 476 feet. This property was idle 30 years. Present operations began 18 months ago. The company has free water. They will put in electric power and a 10-stamp mill. W. H. McClintock at Sonora is Supt.

Sonora, Cal., Dec. 21st '97.

At the Santa Ysabel, No. 3 shaft, No. 2 level, west crosscut, advanced 5 feet, face in hard quartz with a little greenstone; No. 5 level, south drift, advanced four feet with face still in quartz showing some gold. During the month of November the mill ran ten stamps on about one-third time; 227 tons of ore from the Mascot, Central and Knox & Boyle ore chutes was milled, which gave a clean-up of $14.50 per ton. Ten stamps are now running on 15-hour time, and expect very shortly to start the other ten stamps.

Add Butte

Democrat: The Arbona started the ten stamps of its new mill last week. It is operated by water power, a supply of which has been assured the year around. The vein at all points carries an average width of 7 feet that will mill $7 per ton. The rock contains some free gold and a large percentage of high-grade sulphurets. J. R. Sears is Supt.

At the Marble Point the vein is free milling and high-grade. The workings consist of two tunnels, one 20 feet and the other 90, and two shafts 15 and 20 feet. J. Joseph is Supt.

At the Lady Washington a rich chute has been encountered on the 700-level and the owners have instructed Supt. Fisher to draw plans and specifications for the necessary machinery and power drills to run their lower tunnel with all possible speed to tap the ore chutes at the 1400-level.

The Little Pine and Bull Horn placer claims in American Camp are about to start.

Operations have been resumed at the Star, which was shut down on account of scarcity of water.

Supt. O'Connell of the Major McKinley is still sinking a shaft.

It is reported that the Longfellow, near Big Oak Flat, is about to pass to a Chicago Co.

The Gray Eagle, at American Camp, under the management of M. Page, is running.

The Consolidated Eureka is getting out the water that accumulated. Capt. Thomas reports that the stamps will be running soon.

At the Longfellow a 5-stamp mill is being put up. This will be used for testing purposes, soon to give way to a crushing plant of large capacity.

The Ready has its shaft to the 300-level to a tunnel run several years ago. The ledge

at this point is 5½ feet and prospects beyond the hopes of the operators.

Sinking continues at the Grizzly. The last level shows a fine ore body.

At the Dreisam the new steam hoist is in operation. The shaft on the vein has attained 60 feet. Good ore is found.

The Fisher G. D. Co are putting up an additional mill and expect to have it running this week.

Dorsey & Fraser struck a pocket in Jackass Hill. They took out $300 and continued to take out gold every day since.

The Clark Ranch, situated on Deer Flat, has been bonded to Dr. Gould and others.

At the Providence the company are getting their machinery.

Independent: G. W. Plummer and L. A. Engelke have sold the Grey Eagle near American Camp to Koble Bros. of San Francisco.

The Rawhide is running tunnels from the 1300-level.

The shaft at the Ready at the 200-level shows 5½ feet of an average prospect.

Prospects are good at the Skinner and Old Sonora, situated on the Tuolumne river between Jacksonville and Steven's Bar, operated by the Harriman G. M. Co. A prospect shaft has been sunk 85 feet and ore uncovered assaying $60 per ton. A two-compartment shaft will be sunk 500 feet.

W. Sharwood, Supt. of the Soulsby, bonded the Potato Ranch mine, near Phœnix Lake for $50,000. Mr. Sharwood represents San Francisco investors.

Banner: Work began on the Spring Gulch mine, at American Camp, this week.

The California Powder Co. has bonded the McKinley mine at American Camp and are preparing to develop it.

San Francisco people have bonded the Pirate mine, and commenced operations.

The Golden Dawn has been bonded to San Francisco people, and preparations are under way for active operations.

Yuba.

The new mill at the Good Title mine is running on good ore. The new hoisting works will be completed by Christmas and sinking will be resumed. The shaft is 160 feet.

Work is stopped at the Dannebroge and Pennsylvania mines of Brown's Valley.

NEVADA.

The secretary of the Richmond Con. mine at Eureka says during '97 work at the mine has been carried on only by tributers, and that during the year 1022 tons of ore have been raised, containing 834 ounces of gold, 17,955 ounces of silver, and 161 tons of lead. These were sold at Salt Lake City for about $25,000. The Richmond establishment for smelting and refining has cost the company nearly $300,000.

Dec. 10th was the date set for the first payment to be made by the Pecks on the Logan & Hully mine in Como. The Pecks have informed Messrs. Logan and Hully that they could not take the property. The purchase price of the mine was $62,000; the purchase of the Douglass ditch and mill at this place, which was one of the contingents of the deal, would take $40,000 or $50,000 more; a complete reduction works at that point would add at least another $30,000, and a mode of transporting the ore from Como to the reduction works—either a narrow-gauge railway or a tramway—would have brought the amount necessary to carry out the deal successfully close to $200,000, possibly more. When the mine was bonded some three months ago the Pecks agreed to do certain development work on it. This has been done. It is locally asserted that there is now a body of ore in sight close to 250,000 tons, and this ore will average about $15 per ton, from 60 to 70 per cent of this value being gold. Logan & Hully have put men to work to run another tunnel lower down and further develop the property.

Miners have been put at work on the Rabbit Hole sulphur mines in Humboldt county. The sulphur is pronounced by stockmen and metallurgists to be superior to Japanese or Mexican. The mines comprise 480 acres of sulphur bearing territory.

Mgr. Popkiss of the State Line Co. has secured a bond on the Ophir claim. He has opened a body of fair ore, and the company contemplates the erection of a steam hoist.

The Austin *Reveille* is informed that an ore body is struck in the Keystone mine; that the mill will be started up soon, and that a smelter will take the place of the concentrator.

For the week ending Dec. 17th ore shipments were made from Eureka as follows: Eureka Sampling Works, 44,000 pounds; Excelsior, 93,460 pounds; Eureka Con., 66,040 pounds; Jackson, 63,720 pounds; Richmond, 32,700 pounds.

W. J. Nelson, Mgr. of the Boston-Nevada Copper M. Co. of Yerington, says the mill will start the first of the year, and that the company will enlarge the plant to double its present capacity.

OREGON.

The Sanger mine, Baker county, is running full blast.

The Eagle River Placer mine, near Baker City, is doing extensive development work.

W. P. Keady at Sanger is retimbering his mines and putting them in shape for extensive operations.

The Ashland mine was sold last week to Bennett & Reynolds of Minneapolis. The consideration was $20,000. A tramway will be constructed from the Ashland mine to the mill.

Wimer Bros. & Co. are running three monitors at Ashland.

The Victory, at Glendale, is running four giants night and day.

Stein & Bowers are putting in mills with a capacity of thirty tons per day on their Woodville purchase, and driving a tunnel.

C. E. Brown bonded three quartz properties on Williams creek for $10,000.

Ingalls & Friday's last clean-up, six miles below Merlin, averaged $8 per ton. The dyke of porphyry is 60 feet wide.

J. C. Taylor of the Lost Flat mine, near Jacksonville, has a 70-foot tunnel in good ore.

Rowley & Co. have their quartz mill in Uniontown in operation.

Brown Bros. have made a strike in the Canfield property near Jacksonville.

Ten tons of rock from the Free Silver mine, ten miles southeast of Ashland, yielded $45 per ton. The concentrates show $150 gold and 996 ounces silver to the ton.

The Neil Bros. have bonded three claims near Ashland for $10,000 to C. E. Brown.

The Lawrence M. Co. is doing development work on the Matt Johnson property, on Reuben creek, near Ashland.

BRITISH COLUMBIA.

The Dundee M. Co. shipped 540 pounds of ore from its mine near Ymir to London. The ore is principally galena.

The Golconda group, six miles from Greenwood, has been bonded by P. C. Stoess, M. E., of Spokane, acting, it is understood, for the British Columbia D. Co. of London. The amount of the bond is $35,000.

The Evening Star at Rossland shipped 100 tons of ore during the past week.

The Silver Cup, near Trout Lake, employs forty-six men and ships twenty tons per day.

The matte shipments from Kootenay last week were 179¼ tons; total value, $137,860.08 Total value of ore and matte exported for the week, $236,900 03.

The big strikes in the War Eagle and the Deer Park have improved during the past seven days and the showing is better than ever.

The final payment of $47,500 was made for the Porto Rico and Lizzie B. at Rossland last week by the Canadian Pacific Expl. Co.

Smelting returns from a recent shipment from the the Little Joe, at Rossland, are $45 per ton, in gold.

The New Gold Fields of British Columbia, Ltd., has abandoned the Exchange mine near Slocan City. Twenty men have been employed for the past six months, but they have been paid off and the work has been closed down. The abandonment is due to unsatisfactory results, the statement being made that the lead has pinched out. There is a 100-foot shaft on the property and about 150 feet in drifts.

ALASKA.

Improvements on the Thingvalla at Funter Bay progress rapidly. The tunnel is on the vein and will be continued 200 feet.

The Keystone G. M. Co.'s shaft at Funter Bay is 40 feet. The hoisting machinery lately purchased in San Francisco works well. Mr. Cleary is the Supt.

The Hunter Bros. at Funter Bay have driven 65 feet of their tunnel. The rock improves and carries free gold. This is known as the Geyser.

The mild weather permits late work at Silver Bow Basin. The tunnel on the Perseverance has been driven 60 feet. No wall has been reached, though driving across the ledge has proceeded 60 feet.

THE KLONDIKE.

A Tacoma, Wash., Klondike company telegraphed a man of wealth in the East as follows: "We have incorporated for $100,000; profits will be $125,000 monthly. How much stock do you want?" The answer came back promptly: "Will take it all; pay for me out of first month's profits and send me check for $25,000."

IDAHO.

The Cœur d'Alene D. Co. has secured a bond on the Amy group, six miles below Wardner Junction. They have let a contract for extending the lower tunnel 200 feet.

C. S. Jennings of Spokane has bonded the Ainslie group of five gold claims in the Neal district for W. J. Harris, Mgr. of the Le Roi mine. The district is eighteen miles from Boise.

The ores of the Magpie, at Pine Grove, yield $15 per ton in gold. A new mill will be placed in the spring.

UTAH.

Seventy-four cars of ore, bullion and concentrates were billed out of Tintic district last week.

The recent strike in the Mollie Gibson at Tintic assays thirty-five ounces silver and a small amount of gold.

The Old Jordan and Galena shipped 1100 tons during the first fifteen days of December.

This week a 50-ton shipment from the Phœnix was completed.

An average of six cars of ore are leaving Bingham daily.

MONTANA.

Review: Last year the total output of the Butte Reduction works was 3,000,000 pounds of copper; this year the output will total over 8,000,000 pounds.

Nearly all of the W. A. Clark properties in Butte have been merged into the Colusa Parrot M. Co., and incorporated under the laws of the State of Washington. Capital stock $1,000,000.

Miner: The Alice G. & S. M. Co. of Walkerville made a shipment of nineteen bars of gold-silver bullion this week to the refinery at San Francisco. These shipments are made every two weeks and the output the same as usual. The 60-stamp mill of the company is kept busy treating the ore from the Alice. Blue Wing, Magna Charta and other mines are being operated under the management of T. W. Buzzo, and the company is one of the few silver corporations so advantageously managed that dividends can be paid right along, even though silver is not in great demand at the present time. From the Alice, which is one of the oldest and deepest mines in the camp, ore is being hoisted from the 1000-foot level. The ore from the Alice is almost entirely silver, while the ore taken from the Blue Wing carries a great deal of gold. Some very rich ground was recently opened up in the Blue Wing mine, which is less than 700 feet deep. One remarkably rich piece of ore from the Blue Wing has been sent to Omaha as a part of the Montana mineral exhibit at the International Exposition, which opens in that city next year.

The Alice mine is one of the most effective and economical plants in the West, and, it is said, can handle ore that only carries twelve ounces of silver and $1 50 in gold at a profit to the company. It is expected that, even at the present price of silver, the dividends of the Alice Company in the year 1898 will be larger than they have been in the past year. To show something of the development of the Alice Company mines, there are thirty-two miles of open work in the different properties of the company and large bodies of ore blocked out. At the present time the management is doing a good deal of development work, preparatory to increasing the capacity largely as soon as the price of silver goes up to a reasonable figure. In all about 300 men are employed by the company at the mines and mill.

Since operations began at the Ruby mine, Aug. 16th, '97, the mine has produced over $125,000 in gold and silver ore and is now producing at the rate of $2000 a day. In November $70,000 worth of ore was milled and shipped, one carload alone giving returns of $12,000. In October the shipments amounted to about $45,000. It is estimated that there is $1,000,000 worth of ore in sight. The property is developed by a tunnel, although there is a shaft 270 feet in depth on the claim.

The biggest hoisting engine in the West is now being manufactured at San Francisco for the Anaconda Copper M. Co., and, when completed, will be placed at the Diamond shaft, one of the richest of the Anaconda properties.

SOUTH DAKOTA.

At Horn Blende, the new mining camp southwest of Rochford, development work is being done. L. M. Kerney is sinking a shaft. Omaha people are putting down two shafts. Major Simmons is sinking a shaft.

Developments are progressing on the Union Hill Co's. ground at Galena. Ore found in the Eureka shaft goes from $12 to $20.

A body of 4-foot ore was broken into on the Thompson, near Terry, last week, assaying from $8 to $26.

COLORADO.

The Cleopatra M. Co., in Pitkin, has been a dividend payer for six years. The ore is high-grade silver, running over 200 ounces. A. Plewis is Supt.

The Gold Cup, in Gunnison county, is being developed after lying idle a number of years. The ore carries some gold, but the principal values are silver and lead.

The Silver Star M. & M. Co., Silverton, has incorporated to operate on the Letter G. vein, which is a mass of concentrating ore. Work has begun and will be prosecuted during the winter.

A strike has been made in the Newton mine at Idaho Springs by W. E Renshaw. The streak is 10 inches wide and the first-class mineral runs from 10 to 17 ounces gold per ton, besides 100 ounces of silver.

The Windsor Company, operating between Idaho Springs and Dumont, has encountered about 5 feet of solid lead and copper ore in the extension of adit levels.

Work has been resumed on the U. S. tunnel near Idaho Springs. The company has bought the Turner water rights along Clear creek, and will install a very complete plant of machinery and supply the tunnel with electric power for compressors and drills.

The Strong, Cripple Creek, is shipping 100 tons a day to the smelters. The ore ranges at $40.

The Dillon is being developed with a crosscut at 300 feet, but as yet is not a steady shipper.

The Granite has an output of about 500 tons a month.

The Dead Pine is getting up new ore bins and preparing for a much heavier production than the present 500 tons monthly, which averages about $35.

Production from the Hallett and Hamburg goes at the rate of about 100 tons a month, the ore averaging $40.

The Dexter mine at Cripple Creek was sold last week to the Eldorado M. & L. Co. for $25,000. It was a cash transaction.

At the Wautauga, Central City, the main shaft has reached 400 feet. A. P. Kimball is Mgr.

The output from the Isabella, Cripple Creek, the present month will aggregate 2,300 tons, an increase of 50 per cent over last month. Net earnings of the company for November were $8,000.

The Moon-Anchor, Cripple Creek, December production will run 350 tons of 5-ounce average.

Forch Bros. & Heck, Cripple Creek, on the Crown Point, have started active work. An adequate plant of machinery will be erected and work crowded.

Baker & Co., at Victor, are making regular shipments from the Pauper. A shipment was made the 20th, of 18 tons of 5-ounce ore, and 30 tons of the low-grade product.

The Mab shaft, at Leadville, began sinking, all difficulties with the big pump having been removed.

Considerable work is being done on the old Iron mine. While the shipments are not heavy, yet those engaged at work make more than day's pay.

The Crescentia shaft on the property of the Emmett Mining Co., Leadville, has been closed and the machinery removed.

The output from the Royal Tiger, at Silverton, is a carload a day.

At Boulder, a strike in the April Fool opened a vein of sulphides yielding $116 per ton.

The Vindicator at Cripple Creek shipped 300 tons the past week, ranging from $30 to $40 per ton.

The Orphan Boy in Boulder county, owned by a German company, since 1893 has produced $250,000. An offer of $750,000 for the mine is said to have been refused recently. The development consists of a shaft 45 feet deep and two tunnels, 215 and 1145 feet. B. Wise of Denver is Supt.

The Anchoria-Leland M. &. M. Co. will begin within 60 days the erection of a mill, of a daily 60-ton capacity, at a cost of $50,000, at Colorado Springs.

E. De Witt sent out an initial shipment on the Rocky Mountain, Cripple Creek, last week. Specimens were taken out showing crystallized quartz stained with fluorine, showing some gold and abundant sylvanite.

McCormick & Co. of the Tombigbee, on Lawrence townsite, have opened a stringer at a depth of 65 feet assaying from $22 to $400 per ton.

The *Telegraph* estimates the gold production of Cripple Creek for '97 at $13,150,000 This estimate is based upon the fact that for the first eleven months of the year the production amounted to $12,000,000.

The daily output from the Fluorine, at Cripple Creek, is twenty-five tons.

Woods, Townsend & Co of the Christmas, Cripple Creek, output eighty-five tons the past week, consisting of screenings worth $75 and low grade ore worth $30 per ton.

NEW MEXICO.

Development work on the Pinos Altos G. M. Co's. properties is progressing. Surface openings along the vein demonstrate that the ore body is continuous nearly a mile.

The Copper Queen mill, Silver City, will start Jan. 1st.

Jackson & Blatz have purchased one-half interest in the Minnie B, cleaned the shaft and are sinking on the vein, which is 2 feet, carrying copper ore

Crawford & Derbyshire, concentrating the old tailing pile at the Pacific during November, produced 483 tons of concentrates.

A strike was made in the Hidden Treasure, near Elizabethtown, Colfax county, of a 3-foot vein giving values of $80 to $400. The company proposes to add a milling plant.

The Baldy district about Elizabethtown is furnishing evidence of activity. Various operators propose to erect milling and chlorination plants and treat the product at home, shipping concentrates only.

Rubio & Co., Hillsboro, shipped a car of five-ounce gold ore last week.

The last carload of ore shipped from the Brush Heap, Kingston, gave returns of 600 ounces silver and 4 ounces gold per ton.

In the Iron King, at Bland, a large body of ore has been struck.

G. Smith began work at Bland, on the Emerald, Point Breeze and Dolly Varden.

Work on the Albuquerque, near Bland, is progressing steadily.

The New York, largely owned by J. C. Flournoy of Albuquerque, is being developed.

On the Fraction a 3-foot lead of highly mineralized quartz was opened. H. D. Cartwright and T. B. Ward of Santa Fe are the owners.

Bland *Herald*: Deeds transferring the Albemarle group to the party headed by Mr. Posey have been placed in escrow in a Denver bank. The extent of option is nine months, during which time $75,000 is to be expended in the development of the property. The bond call for the purchase price of $150,000.

ARIZONA.

A shipment of a 50-pound bar of bullion was made last week from the Gold Cliff at Pearce.

W. G. Blakely is Supt. for an Eastern Co., which is operating in the Cedar district, in Mohave county. A 5-stamp prospecting mill is in operation.

Major Hampton is shipping twenty-four tons of six ounce gold ore from the Hampton & Leffler lease on the Oro Plata, in Mohave county.

The Temple Bar M. Co. is constructing the works to extract the gold from its gravel bars on the Colorado.

Work on the Grant group at Guijas is progressing. A. B. Sampson is the Supt.

At the Old Dominion, it is said, little work will be done until the railroad reaches Globe.

A new bond on the Continental mines was recorded Dec. 1st between W. Sidow, J. H. Morley and N. L. Amster. The original bond called for the payment of $40,000. The new bond expires June 1st, '98, and the price is $30,000.

LOWER CALIFORNIA.

News from Calmalli is to the effect of a general strike among the miners in the employ of the Ibarra G. M. Co. Work in the various shafts has been suspended, and the cyanide plant only is in operation. It is not learned that the miners have any particular grievance, and the only reason seems to be that they are tired and want rest or a change. Work will probably be resumed in a few weeks with a new force, according to the *Lower Californian*.

MEXICO.

Ground for the Juarez smelting plant of the Corralitos Mining Company has been laid out near the north end of the yards of the Corralitos railway, and a spur track is being now built to the location.

The steamer Orizaba, which reached Guaymas from San Francisco last week, brought 200 tons of copper from Santa Rosalia, the third shipment by the Boleo Co.

A City of Mexico dispatch says the sale of the Inguaran copper mines to Rothschild & Mirrabeaud of Paris, for several million dollars, is the result of prolonged investigation. Messrs. Rothschild & Mirrabeaud will build two lines of railway, one to connect with the western branch of the Mexican National Railway and the other with the west coast, so as to have connection with the Pacific ocean.

ONTARIO.

The Golden Star M. & D. Co. are down 111 feet and have a level at 75 feet. The north drift is 107 feet, and the south is 54 feet. The next level will be started at 175 feet. After developing the mine the company will erect a stamp mill. A. C. Hubbell of Duluth, Minn., is Pres.

Mechanical Progress.

Water Power and Momentous Changes.

The purposes for which water power is being utilized are greatly varied. It is used directly as electrical energy for lighting purposes and for chemical and metallurgical operations. Transformed again into mechanical energy by means of the electrical motor, it is used for working tramway systems, for producing wood pulp for paper making, and for driving machinery of all kinds at the mines or in engineering and other workshops. The significance of this new step forward in the application of water power to industrial purposes is startling. On the one hand, it signifies that man has at last learned how to effectually master and utilize one of the mightiest natural forces of the earth.

Coal is an exhaustible possession, and the day must come when the coal fields of the earth will be worked out. Our rivers and falls offer, on the other hand, an inexhaustible supply of energy; for so long as the heat of the sun evaporates the water of the sea, and causes it to fall again as rain upon the hills or as snow upon the mountains, this source will be available for the supply of man's wants, and the arrival of the time when the earth's coal fields will be exhausted need no longer be awaited with misgivings. But there is another aspect of this development which is less cheerful for contemplation by three of the nations of Europe. The position which England, Germany and Belgium occupy to-day as the leading manufacturing countries of Europe has resulted chiefly from their possession of extensive coal fields capable of cheap development, coal having been in the past the chief factor in determining the industrial progress of any country. The progress of electrical science has, however, apparently changed the conditions of industrial supremacy, and it appears as though the possession, not of coal fields, but of water power, will be the determining factor in the future.

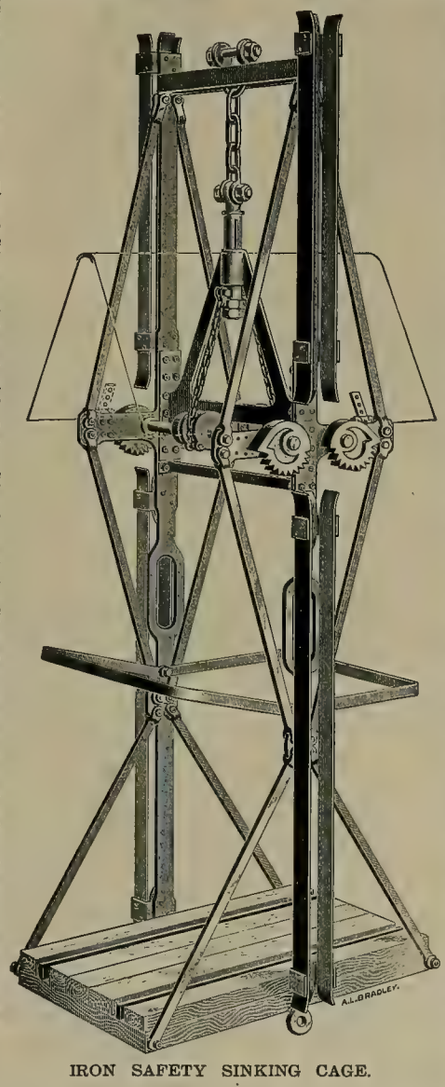
Whether the check of the natural growth and expansion of industry in the older manufacturing countries of Europe, that may already be observed as one result of the increased use of water power in countries hitherto of little or no account in the industrial struggle, will be followed by the gradual migration of the staple industries to the cheaper centers of power remains for the future to disclose, but it is a question of tremendous significance for the prosperity of the countries concerned.

Advantages of Hydraulic Riveting.

The first important point to be attended to when riveting is to be done is to see that the holes are properly punched or drilled, and the rivets of a size to fit the holes. In boiler work the drift pin is too frequently used to bring the holes fair with each other, to the discouragement of all good work. The next thing is to see that the rivets are long enough. Good work cannot be done if the rivets are not of sufficient length to allow a proper head to be turned up. Also the rivets must fit the holes. With a rivet too small to properly fit the rivet hole good work is an impossibility. The plates must further be held closely and firmly together when driving the rivets. It is one of the strong points of hydraulic riveting that the plates are forced together and held there while the riveting is being done; and in hydraulic and other power riveting it is of vital importance that the rivets be of sufficient length. If a trifle too short when hand riveting is done, the rivets can be coaxed into shape after a fashion; but with the machine riveter there is no chance of doing even a half decent job unless there is stock enough in the rivet to fill the machine set. The test of sufficient rivet length is to have a slight fin or rim of metal crowd out the ball around the heading tool. The fin need not be very wide—it should not even require removing but it should be there and of even width all around the outside of the heading tool. In hand riveting the best work is done when a rivet is driven here and there, bolts being used in the other holes to clamp the plates together while the intermediate holes are being riveted.

Safety Sinking Cage.

The engraving shows a new iron safety sinking cage in which the details are so clearly portrayed as to make no explanation necessary. It is manufactured to order by the E. P. Allis Co., 9 Fremont St., San Francisco, to suit the size of shaft, with track of the required gauge.



IRON SAFETY SINKING CAGE.

In the operation of the plant of the New Jersey & Pennsylvania Concentrating Works the dust was for a long time a great nuisance in the bearings of the elevators and conveyors. At last Mr. Edison came to the conclusion that as it could not be got rid of he would turn the bane into an antodote. He now has a form of oil feed and bearing in which, after the oil is fed, the bearing is dusted over so as to prevent the oil running away. Dust from the surrounding air soon cakes on additionally, but as soon as the film grows too thick and heavy it is automatically flicked off, when the oil feeds again. The dust skin or shell reforms and the same cycle is repeated indefinitely. The bearings are thoroughly protected and once a month is often enough for refilling the oil cups.

Probably the largest penstock ever used in connection with the development of water powers in Canada is being built at the works of the Laurentide Pulp Co., Grande Mere, Que., on the St. Maurice river. The main penstock is 14 feet in diameter, made from $\frac{7}{16}$ inch steel plate, 550 feet long, and with its branches has used in the neighborhood of 300 tons of plate.

Our New Mexico and Arizona traveling correspondents write that there is a growing demand throughout that entire region for gas engines, wherever wood for fuel and water for steam or electrical purposes are scarce. There is a big future in the trade of gas engines; the innumerable uses to which they are applied are a recommendation and sure to create a demand. A gas engine expert says there are to-day American gas engines being extensively used in Europe. In Paris there are engines of 600 H. P. that were made in this country some time ago. Any town where ordinary gas is manufactured can be made a field for the sale of gas engines, and the use of crude oil and gasoline enables country residents to utilize the power. Gas engines are made from ½ to 600 H. P., and the many uses to which they may be put are extraordinary. Central and South America are beginning to buy these machines, and it is expected that as their many uses are shown the demand will increase.

The plan of winding steam pipes over 8 inches in diameter with $\frac{3}{16}$ inch copper wire, thus nearly doubling the bursting pressure, is an important change in engineering practice. That the thickness of sheet copper forming the pipe may be reduced to the minimum, and at the same time insuring the full advantage of wire winding, an improved system of manufacturing steam pipes has been devised, described as consisting in simply using copper of the thinnest possible gauge to form the interior or core of the pipe, while the body proper is composed of steel wire wound closely around the core, the interstices being filled in solid with copper by electrodeposition. Increased strength comes from wire winding.

The chainless bicycle is the latest. It will not prevail. Bicycle makers have taught a good deal on the general subject of locomotion, and it is not impossible that locomotive makers may take radical lessons from them about building locomotives. There is much that might be learned and adopted about the use of tubing, and why not also about the use of the chain? All have more respect for the chain as a power transmitter than they had ten or twenty years ago. It is believed to be entirely practicable to-day to build a locomotive with high speed, perfectly balanced, smooth running and economical engines and chain transmission to all the axles. With electrical manufacturers intent upon swallowing everything in sight, it can scarcely be pretended that the time-honored old locomotive is as safe as it once was, and there was never a time when revolutionary suggestions were more permissible than now. With electricity substituted as a motive power for steam, and chain transmission to all the car axles, that would be, indeed, a revolution in locomotion to wake Stevenson from the dead.

In reply to an inquiry as to what method can be adopted in the construction of a connecting rod, to allow for the adjustment of the brasses and still keep the rod of a uniform length, it may be said that this can be done by constructing the cross-head end with a tapered key and gib, as ordinarily used on stationary engines, and the crank-pin end of the marine type, with two through bolts, bolting the brasses to the butt end of the rod. In this way the adjustment of the cross-head end brasses for wear lengthens the rod, and the adjustment of the crank pin brasses for wear, shortens the rod. A change in length of the rod, if any, will then be caused by the unequal amount of wear of the brasses at either end.

Electrical Progress.

How To Become an Electrical Engineer.

Written by George B. Lauder for the *Electrical Review*.

If the young man asking advice is able, from a financial point of view, to study electrical engineering in some of the reputable schools or colleges in this or other countries, he should do so as the quickest and best means of getting much of the required knowledge. At the same time he should make it a point to become as familiar as possible with the practical applications of electricity previous to commencing the study and during the vacations, as, by so doing, one is able, from the practical experience so gained, to more easily understand the theory. Practical training may be gained by working with some electrical construction firm or in some electric light or power station. Any further advice in a general way would seem unnecessary, for there would be but the one sensible course to be pursued by such a young man.

Presupposing that the seeker for advice is 18 years old, has had a common school education, but is unable, from the lack of the necessary money, to prepare for and take a course in electrical engineering, the writer, acting both on practical experience and from observation, would submit the following advice:

Starting with the above conditions, it will be possible for a determined young man to become an electrical engineer at the age of 30, though not much, if any, before, for the twelve years are none too many in which to prepare. To be sure, as many have done, one might, after two or three years' experience as a wireman, hang out his shingle: "Mr. So-and-so, Electrical Engineer;" but the ability of such a one would exist solely in his own imagination or through the ignorance of those with whom he came in contact. Our young man must not only work hard during the day, and do it every day, but, together with that, he must devote most of his evenings and other spare time to studying books, and in that way get the benefit of the work and knowledge of those who were before him. There is no other way, and unless that is done faithfully and continually, success as an electrical engineer is impossible.

The first step is to go to work for some concern which does wiring for electric lighting, and learn how to wire houses, etc., not with the idea of becoming an expert wireman, but because, by so doing, one can obtain, probably as quickly as possible, some conception of one or two of the first principles of electrical science. Two years should be enough in the wiring business, and it would be well to drop it at the end of that time. During these two years some conception of "volts," "amperes" and "Ohm's law" should be forming in the young man's mind, and he would be learning his needs in regard to reading matter. It would early be advisable to send to the *Electrical Review* for a catalogue of their publications on electrical and kindred subjects, to select a few of the simplest works on electricity and to try and read them understandingly. A thing should not always be taken for granted simply because some book states that it is so; one should satisfy oneself that it is so and why it is so, for then one is reading intelligently and to one's great profit. It is very probable that our reader will find himself floundering before progressing very far in his study, certainly a little later. When he does he has, even thus early, arrived at one of the critical points in his undertaking, and, as he then does or does not, so will he meet success or failure in the future. If he would be successful he must, when he finds he is not reading understandingly, learn the reason why and at once begin another line of reading and study which will

lead up to and make clear the misunderstood matter; and, if he will do so faithfully and in every instance, he will be successfully fighting for the honest name of electrical engineer.

Now, having spent two years as a wireman, and in starting his line of book study, our young man is 20 years old and ready for the next step, which should be to get in with some electric lighting or power company in some small city of from 15,000 to 20,000 inhabitants, and go to work in the station (a station using steam power would be necessary now or later), and in that way open an acquaintance with other principles of the science. A wise young man will not hesitate to keep himself in the best standing with his fellow-workmen, to act the part of a man willing to work, and at all times to bear in mind that he can learn something from others. Here he will have opportunity to become familiar with dynamos and other apparatus, to trace out connections on switchboards and elsewhere, to learn how to repair arc lamps, meters, etc., and will unconsciously become familiar with certain principles, and be constantly opening up new fields for thought and study. Steam engines and boilers should be considered, and our young man should begin to read the very simplest works on steam engineering, and to advance in such reading as fast as it may be done understandingly, but no faster. It will early become evident that a systematic and thorough study of mathematics is absolutely a necessity, and, as time goes on, the study of mathematics must continue.

The question of saving money must be constantly kept in mind, and at the very start a method of saving—as much as may be done without bodily discomfort or loss of health for want of proper care—should be adopted and adhered to during all of the twelve years, for, if the lines herein suggested are followed, the money will be needed by and by.

The writer would advise the young man to stay with the electric company, either with the same or different ones as opportunities present themselves, until he is 24 years old, and during that time to continue his work, study and money saving on the same general lines as have been already laid down. At the age of 24 he should be ready, and it would be advisable for him, to take a special course in some one of the best scientific colleges in this country, covering two years in time, and in so doing to make it a point to get a knowledge of the fundamental principles of chemistry, an insight into the higher mathematics, some training in mechanical drawing and some knowledge of mechanical engineering, and as much knowledge of theoretical electricity as can be obtained in that time. Of course three years would be better than two, but more than three would not seem best at this age. Advice regarding the individual studies to be taken up would be out of place here, for our young man at 24 would know himself about what he needed.

The question of money with which to pay tuition and the expenses of a special course is liable to be a serious one, as quite likely it will have been impossible to have saved enough for the purpose. There are, however, a number of things which may be done. Perhaps a friend or relative may be found who will advance the amount necessary; it is practicable to take out a policy in some life insurance company and borrow the money with the policy as security; one might be fortunate enough to obtain a free scholarship and thus save the bulk of the expense. There will be found, as a rule, some way of getting the money needed, but, if not, the course must be taken at a later time. After completing the special course the young man could do himself much benefit by spending a year or two in some modern machine shop, to learn the construction and operation of machinery in general, to look into designing, if possible, and at all times to continue reading up in mechanics, steam and electricity. The remainder of the time could be well spent in one of the larger electrical manufacturing companies in the country. The writer knows two young men, neither of whom is 30, who have lived much after the ideas set forth in this communication, and who are rapidly approaching the time when they can truthfully style themselves electrical engineers.

THE use of power electrically transmitted from waterfalls, already very large, is increasing. At the present time the total of the larger installations in the United States is 80,000 H. P., which will be increased to about 150,000 when the Niagara scheme is completed. This does not include the numerous small water-driven plants in the mining districts of the western half of the nation. Switzerland comes second, with 32,000 H. P. This figure will be increased to 48,000 when the second water-power plant on the Rhone near Geneva is completed. France follows with 18,000 H. P., which will be increased to 30,000 by the completion of the power plant near Lyons. Germany has only one water power of any magnitude—that at Rheinfelden. This will yield 16,000 H. P. when completed. Italy has 18,000 H. P.; Sweden and Norway, between 10,000 and 20,000 H. P. each, with almost limitless possibilities of further development. England and Scotland bring up the rear with only 4000 H. P., which is due to the circumstance that the surface formation of those countries does not permit of a very frequent application of water as a motive power.

Scientific Progress.

Long-Distance Telephony and the Railroads.

It does not seem within the scope of the ordinary human understanding that the immense passenger traffic of a railroad of the marvelous extent of the Pennsylvania Company, or any similar line, could be visibly affected by the long-distance telephone. Such a statement ordinarily would be received with ridicule and laughter by the common railroad officials, and treated with contempt by the higher authorities. Yet, no lesser personage than James McCrea, the head of the Western branches of the Pennsylvania system, told President M. E. Ingalls of the Big Four and Chesapeake & Ohio railroads that the business of the famous limited train of their company had been practically ruined by this instrument. These two gentlemen met in consultation in reference to commercial relations between the two lines, and during their negotiations the subject of the falling off of the passenger traffic of the country was brought up. Various reasons were given, when Mr. McCrea made his decidedly sensational statement. It is well known that the Pennsylvania Limited was originated and run in a measure for the benefit of the brokers and business men of Chicago and the Northwest, who needed quick action in the matter of travel. The trips to New York were taken upon occasions of utmost importance, when time meant thousands of dollars. By means of the Limited the broker or business man was taken to New York in the quickest possible way. There was no delay in getting there; it meant rapid business talk, and equally as quick a return to Chicago. The business man was willing to pay the price assessed for the development in rapid transit displayed by the Limited.

Then came the introduction of the long-distance telephone. People were slow in realizing its benefit. Slowly but surely they have, however, acquired its significance. A broker in Chicago or a grain dealer in that city has an idea for a big deal; he telegraphs to New York asking for certain information: "Call me up by long-distance telephone and give me your answer." The result is that for $15, perhaps $20, a talk is held with the New York man. He has had an opportunity to concentrate his expressions to the shortest possible statement; he has even jotted it down, and at the proper time calls up his man and transacts business. So it is done every day. Mr. McCrea gave as an evidence that in the past he found it necessary to spend twenty days in the month on the road, leaving but ten days of his time at home. By the aid of the long-distance telephone now he has reversed matters; it requires but ten days of his time upon the road, giving him twenty days at home. In Cincinnati, O., grain men, who have been in the habit of making two and three trips a week to Chicago, say: "Oh, yes, that has been the case with me; I have, for $3 or $4, been able to transact business which otherwise meant a trip to Chicago or St. Louis." The same way with commission dealers and brokers. They indorse the statements of the grain men, and state that the telephone has saved them numerous trips. The financial brokers and bankers use the telephone continually now; in fact, it is quite the feature of several of the more prominent brokers since they have their long-distance telephones, but it has never become so prominent a factor in railway circles as has been stamped by Mr. McCrea's utterances. If it practically interferes with a great train like the Limited, a revolution is certainly taking place in railroad affairs.

A Railroad That Lifts Itself.

In Halford's patent railway the immediate motive power is the force of gravity, and the cars are, as it were, always running down hill. This result is achieved by making the permanent way in sections, whose length is to be determined by engineering considerations, hinged together and supported at each end on hydraulic rams. As the train reaches the junction of two sections it puts the hydraulic machinery in action, so that the ram rises, lifting the end of the section, together with the cars that are upon it. The train thus has a decline, down which it runs by its own weight, and as the same process is repeated with each section, it is practically always running down a falling gradiant, continuous though of varying steepness. The necessary hydraulic power is conveyed through a pipe laid beneath the rails, and the admission of water to the cylinders of the rams is controlled either by electrical means from the cars, or by the weight of the train depressing the section it is about to leave, and thus actuating the supply valve. In the model built by the inventor the rails are raised on columns and the cars suspended on either side below the track, but the system is claimed to be equally applicable to trains running above the rails in the ordinary way, though in that case it is considered that the limit of speed consistent with safety would be much reduced. With a full-sized railway the stroke of the rams necessary to produce a high speed would, it is claimed, not be very long, and the passenger would experience little, if any, of the switchback motion which might at first sight appear inevitable. As a model the invention works prettily.

An Arizona Pickling Plant.

The Arizona Timber & Lumber Co., at Bellmont, is under contract to the Santa Fe Pacific to supply hewn ties for six years. The life of a tie is only four years. The Wellhouse patent, which has run out, will remedy this, extending the life of a tie to thirteen years. In the main building are two cylinders, each 110 feet in length, the pump and six compressors. To the north are two large tanks, set on a score of pillars of cement. East are two buildings for storage of chemicals and general supplies. Adjoining is a vat house with a tank in which is made concentrated zinc chloride solution. This tank is lined with lead three and one-half tons weight. The materials necessary to the solution are transferred by the trolley from the storage building. Steam is used in the cylinders and for motive power. On a platform 22 feet wide by 500 feet in length ride the cars loaded with ties, held to the iron trucks by chains. Thirteen of these cars will run into each cylinder, each cylinder having a capacity of 400 8-foot ties, when the cylinders are hermetically sealed. A "nigger" is operated at each end of the platform, the means of drawing the thirteen cars or trucks to and from the cylinders.

The treatment begins with sealing the ties in the iron cylinders or retorts. After the vacuum in the cylinders or retorts is pumped, steam is turned on for five hours. A vacuum is again created and then the chloride solution is forced into the cylinders, this solution being the antiseptic that enters into the wood and prevents decay. This pressure of 100 pounds to the square inch is kept up two hours. The entire treatment runs from twelve to fifteen hours. The two tanks outside of the pump room contain 95,000 gallons, one carrying the zinc chloride solution and the other the tannin solution, both necessary to the complete execution of the method of treatment, after the wood has received a steam bath. A tank lined with five tons of lead stands beside the two larger ones, this containing concentrated zinc chloride, which is fed from the tank previously mentioned. The whole process of handling ties from the loading on the trucks and taking a course of treatment to that of piling up again in the yard ready for delivery costs the railroad 15 cents per tie.

There are now 120,000 safed ties on the grounds. The capacity of the plant is 1000 ties per day. Ninety men are employed.

SPOKANE and Tacoma, Wash., Portland, Or., San Francisco, Los Angeles and San Diego, Cal., are to be connected by the longest telephone system in the world. The circuit will be 1800 miles in length between Spokane and the Mexican boundary. The Sunset Telephone Company's northwest division is preparing to build across the Cascade mountains in '98, connecting by a direct line Tacoma and Spokane, which now talk to each other via Portland and The Dalles. At present the Sunset telephone line runs southward to Eugene, Or., then to Redding, Cal., a distance of 300 miles, through the Siskiyou mountains. This gap is to be closed next year. A series of circuits which can be connected in a continuous line is now in operation between Boston and Omaha. This line is about 1700 miles long, 129 miles shorter than the Spokane-San Diego line. An extension to Helena, Mont., is not improbable from Spokane. This would make the line 2211 miles in length, and make a long-distance record not likely to be equaled until the company gets its proposed line to the Klondike in operation.

THOUGH the ramie plant is susceptible of cultivation in southern California, Arizona and New Mexico, one difficulty in the way of its use has been to find some cheap method of preparing the fiber so as to get rid of the gum it contains. It is reported that a London firm has solved the problem by the discovery of an infusion that extracts all the gum from the fiber. If so, this will lead to the use of ramie on a large scale, as when thoroughly cleansed it can be woven into fabrics almost equal to silk.

Manganese Ores.

Ores of manganese were produced in seven States in the year 1896, the total mined being 10,088 gross tons, valued at $90,727, or $8.99 per ton. This total, which embraces only the ores extracted from the earth and marketed as manganese ores, represents a slight increase over the previous year's output of 9457 gross tons, a gain of 541 gross tons, or 5.67 per cent. The amount and value of the manganese ores produced in the United States in 1895 and 1896 are shown below:

	1895		1896	
States.	Production. Gross tons.	Value.	Production. Gross tons.	Value.
Alabama	2 991	$20,937	3,421	$36,686
California	525	5,400	284	3,415
Georgia	3,886	27,416	4,085	27,032
North Carolina	....	....	2	17
Pennsylvania	460	2,300	265	1,988
Virginia	1,715	15,656	2,018	21,485
West Virginia	....	....	13	104
Total	9,547	$71,769	10,088	$90,727

Amending Federal Mining Laws.

To the Editor:—I find in your issue of the 11th inst. an article by Mr. E. H. Moore of Nevada City, Cal., in opposition to my proposed amendments to the mining code. I infer that Mr. Moore is an engineer. He has expressed his opinions honestly, no doubt, and therefore I can take no exception. Every man is entitled to his opinions as to the mining laws as much as to those of his religion or politics. This matter is entirely impersonal. The fact that I have taken part in twenty-three vigorously contested mining lawsuits is my apology for desiring to keep my mining friends free from such costly amusements. Of these twenty-three suits, the least expensive was the Mt. Diablo-Callison case, which cost the former company $35,000, and was characterized by my friend Judge John Garber as pleaded *in forma pauperis*. The Eureka vs. Richmond, the Eureka Hill vs. Bullion-Beck and Champion, the Iron Silver vs. Williams, the Raymond-Ely vs. Hermes, in all of which I was chief expert, cost the litigants not less than $150,000 each—all of which was money unnecessarily thrown away and filched from the owners of the mines.

All this expense was due to the absurd provision of the "extra lateral" right. Mr. Moore is of the opinion that I am "radically wrong." It is hardly sufficient so to say, and I ask Mr. Moore to give some reasons why I am radically wrong.

Will he kindly answer the question, "Is or is not the extra lateral right the chief cause of our ceaseless litigation?" I would ask him to study the Report of the Public Lands Commission, Ex. Doc. 46, Washington, 1880, and see how few of the mining men, surveyors-general, deputies, registers and receivers disagree with me. I have the best interest of the legitimate miner at heart. I have no sympathy with monopolists, rich or poor. I have sent Mr. Moore a copy of my address before the Miners' Convention and also of the provisional code as formulated by the committee at Denver.

I would ask for his criticism, as well as that of any other well-wisher of the mining industry, and trust he will send it to you for publication. I am in favor of 1500x1500 feet for a lode location. This, by Mr. Moore's own calculation, will give a depth, on the dip of 45°, of more than 2000 feet. The law as proposed by the committee allows ninety days before definite fixing of the boundaries of the claim; and if the locator shall be sufficiently far-seeing, he can take a second claim on the side of the dip, which will assure him a potentiality of over 4000 feet on the line of the dip, even at 45°.

I call Mr. Moore's attention to the map made by Mr. F. J. Wrinkle, mining surveyor, Virginia City, Nev., to illustrate his testimony before the Commission. We all of us know or knew Messrs. James and Wrinkle. The former was all too early called away from us. No better surveyors have ever officiated in our country. Mr. Wrinkle, I am free to confess, favors the "extra lateral right," but his own statement of facts and his own map emphatically enforce my own conclusion. Look at the map! A series of two parallel locations of a width of 1500 feet each—in all 3000 feet—will cover every bonanza found in the Comstock in nearly forty years, extending from the Maryland below Gold Hill to the Utah on Cedar Hill, north of Virginia City, with the single exception of the bonanza found in the Union Con. and Scorpion. Two such locations would have in no way prevented excavations in depth on the principal claims on the Comstock and would have saved to the stockholders, the mine owners, the $10,000,000 spent in useless litigation from 1860 to 1865.

I am pleased to see that Mr. Moore agrees with me that the "local rules and regulations" should go. Some years ago such an acknowledgement would have been combatted as an unjust interference with the god-given right of an American citizen to do as he —— pleases.

He is also good enough to agree to accept my proposition to make the acquisition of a patent less costly to the miner. This is expressly provided for in the proposed code, viz, that honest work, to the value of $500 for five consecutive years shall suffice in order to apply for patent.

As to the sixth resolution I propose that the locator shall be permitted to locate 3000 feet of the channel, dead river or deep placer, as soon as he reaches it. Let him take the whole of it together with a reasonable amount of ground on each side.

If 3000 feet of the channel be insufficient, would Mr. Moore kindly write to any member of the committee and make such suggestions as to him may seem good?

My seventh resolution, "faulty" as it may be, is now the rule of the Commissioner and is the law of the land. The last decision of the Land Office at Washington allows a patenting of any mineral substance occurring in sufficient quantity and quality to make the "land more valuable, by reason thereof, than for agricultural purposes."

My eighth proposition is not a "confiscation of the property of a miner or prospector without capital" for the reason that work for five years at $100 per year renders the claim immune or free from any further expenditure other than the payment for the ground at $5 or $2.50 per acre, as the case may be.

I fail to see how these or any of these resolutions "ties up the prospector's pick."

Security of title is the aim and object of all of them and a prospector can more easily sell a definite quantity of land having within it mineral than if it be sold subject to the proof that he has the apex of the lode which he offers for sale.

Mr. Moore says that our own laws are the "most free on earth."

If he had said that we have no laws at all he would, almost exactly, have expressed it. When a shotgun argument or a heavy purse can be invoked against a poor man, where can we find any law? When the Government allots a claim, the authority granting it should see that it be respected and neither brute force nor money should be potent enough to dispossess the rightful owner (the locator).

Mr. Moore is absolutely in error as to the necessity of asking a concession for a mine in Mexico. I am to-day applying for certain claims "pertenencias," in Mexico, and I have not asked nor I have been obliged to ask any concession from anyone. A "permit to prospect" on private land must be asked from the owner, which generally is freely given because the ranch owners are very desirous of having work done within their limits so as to sell the products of their ranches. Such permits cannot be demanded in the United States. Further, the taxes are not nearly as heavy as in our country in view of the cheaper labor and materials required in Mexico.

Mr. Moore says our only requirement is citizenship actual or intended. That is true, but it is, in my judgment, a most illiberal one. All the Spanish American countries allow an "inhabitant" to take up mining ground.

If Canada were as illiberal as we of the United States, the hegira to the Yukon region would be greatly curtailed. I do not defend the reported heavy taxation of the miners; in fact there is no certainty whatever that it will be enforced. I have spoken with a number of miners who have worked both placers and lode mines under the British flag and have not found a single dissenting opinion as to the fairness and security of title under that system.

W. S. Keyes.
Member of Committee.
San Francisco, Dec. 14th, '97.

To color iron blue, 140 grams of hyposulphite of soda are dissolved in a liter of water (four and two-third ounces to one quart); thirty-five grams of acetate of lead are dissolved in another liter (one and one-sixth ounces to one quart); the two solutions are mixed, made to boil, and the iron is immersed therein. The metal takes a blue color, such as is obtained by heating it.

Proposals Invited for Electrical Apparatus.

In accordance with the act of Congress, approved July 19, 1897, the U. S. Navy Department is inviting sealed proposals until January 29, 1898, for the construction by contract of a Government armor factory, as a whole, in accordance with the plans and specifications. Proposals will also be received at the same time for furnishing separately the whole or any part of the machinery embraced in such a plant. The following is the electrical equipment required: One electric charging machine; two 160-ton and 75-ton electric overhead traveling cranes, with special hydraulic lifts; one 160-ton, one 100-ton, five 75-ton, one 50-ton, one 20-ton and one 5-ton electric overhead traveling cranes; three electric portable grinders; three sets of electric multipolar generators of 400 K.W. capacity each, and each with engine complete; about twenty-five electric motors for operating tools of varying sizes; arc and incandescent lamps, and wiring for entire plant.

All bids must be accompanied by specifications and drawings, showing in detail the machinery proposed to be furnished. The Department presumes that, should an appropriation be made by Congress for the erection of this plant, successful bidders will be required to enter into contract and give satisfactory bond in a penal sum for the performance thereof within the time specified in their proposals. The bidders will distinctly understand that no such appropriation has yet been made, and that not only is the usual right reserved by the Department to reject any or all bids, but that under the statute authorizing proposals the Department will report to Congress the receipt of all bids made, and await its further action. The time in which the work can be delivered or completed must be stated in the bid, and in considering the bids weight will be given to this statement, and also to any statement which bidders make as to the security which they will furnish for the faithful performance of any contract awarded to them.

Prospective bidders should apply in person to the recorder of the Armor Factory Board for information as to details, specifications and plans of such a plant, and for opportunity to examine and use the same in preparing their proposals. Proposals must be addressed to the Secretary of the Navy, Washington, D. C.

Recent California Mining Incorporations.

Eskimo M. & T. Co., San Francisco; capital stock, $250,000; subscribed, $5000; C. P. Yore, G. O. Perry, T. M. Scribner, M. W. McIntosh, D. J. Wren.

Klondike G. M. & E. Co., San Diego; capital stock, $25,000; subscribed, $2005; F. J. Land, T. G. Farmer, N. M. Goodwin, P. F. Ropell, C. A. Ryan.

West Australian P. G. O. R. Co., San Francisco; capital stock, $50,000; subscribed, $10,000; J. Gruss, W. J. Gruss, E. Gustreto, G. Gruss, H. L. Schemmell.

Genevieve M. Co., San Francisco; capital stock, $250,000; subscribed, $250; W. P. Scott, A. J. McGovern, M. B. Woodworth, T. M. Carroll, W. Royal, A. H. Warren, E. Carroll.

Jane Morgan M. & M. Co., Stockton; capital stock, $500,000; all subscribed; J. E. Kidd, R. B. Telfy, B. Kidd, T. H. Ganeard, A. R. McDonald.

Recently Declared Mining Dividends.

Gold Coin M. L. Co., Colo., 1 per cent, $10,000; Dec. 25.

Dutch M. & M. Co., Tuolumne Co., Cal., 5 cents per share; Dec. 22.

The Utah, Utah, $1000; payable Dec. 25.

Mount Morgan G. M. Co., Australia, £25,000; 6d a share for the month of November.

Ontario S. M. Co., 75 cents per share; payable Dec. 31.

Homestake M. Co., S. D., regular monthly dividend, 25 cents per share, and extra dividend, same amount; payable Dec. 27.

Napa Con. Q M. Co. a quarterly dividend of 10 cents and 10 cents extra, payable Jan. 1 to stock of record Dec. 18; 70 cents paid during year. The company is earning at the rate of $1 to $1.25 per share. For the last six months net earnings amounted to $57,000, and $40,000 in dividends were paid, leaving surplus of $17,000.

Coast Industrial Notes.

—California built more miles of railroad (210) in '97 than any other State in the Union.

—Moran Bros. of Seattle, Wash., have a contract from an Eastern "Yukon Co." to build ten steamers and twenty-four barges for $1,000,000.

—The Robertson Raft Company has a contract for 1,000,000 feet of piling, to be made into a raft at Stella, Wash., on the Columbia river and towed to San Francisco.

—The United States increased its export business to Mexico over 12 per cent during the last fiscal year, showing that American goods are satisfying the Mexican trade. American exporters now supply over 50 per cent of all that Mexico imports, and '98 will see this percentage increased.

—Secy. of War Alger, has ordered 600 reindeer and their drivers from Norway, to take food to Dawson. Better use American and Canadian horses. The sooner the better food is got in there, and now is no time to begin making fanciful experiments with reindeer. They will cost $80 each landed at the foot of the Dalton trail.

—The new ferry-boat between San Francisco and Oakland will be built by the Union Iron Works. It will cost $200,000 and will be completed May 1st, '98. When the new boat is put on the line there will be a twenty-minute service between Oakland and San Francisco during the hours of heavy travel, instead of the half-hourly service now given.

—This week there were shipped from Pleasanton, Cal., eighteen carloads, 1306 bales of hops, the last shipment of this season's crop from the hop yards of that place. The total harvest there was 2400 bales, or 475,000 pounds, of cured hops. This entire crop has been sold to a single customer in London. This crop has averaged 1900 pounds to the acre. It has brought within a fraction of 20 cents a pound. The gross figure was $90,000. The harvesting caused the distribution of $20,000 to 2000 pickers.

—The Mexican government appears to be reaching for the control of its Pacific coastwise traffic, which at present is wholly in the hands of the owners of the several American steamship lines that ply between San Francisco and Panama. The object embraces the construction of a port at San Jorge, at the head of the Gulf of California, and the building thence of a railroad ninety-six miles in length to Yuma, Arizona, here making connection with the Southern Pacific. Only eighteen miles of the road would be within the United States.

—There are at present in San Francisco 15,000 bales of cotton awaiting shipment to Japan. During the season of 1896-'97, closing October 31, 1897, the S. P. Co. brought out here and shipped to the Orient 37,000 bales of cotton. From November 1 to the present time they have brought from the Southern States, chiefly from Texas, to San Francisco 30,550 bales, part of which is still to be shipped. There is also an equal increase in the volume of cotton shipments by way of Portland and Seattle. At those places, too, there are large quantities of cotton waiting to be transported to Japan.

—The output of California salmon fisheries this year is 17,695,000 salmon. In the State hatcheries are 24,000,000 salmon eggs that will be hatched and liberated in 1898. The effect of the salmon laws is clearly marked by the collection of salmon eggs at the egg collecting stations on tha headwaters of the Sacramento river. At the Baird station 9,000,000 eggs were collected. At the Battle Creek station 48,000,000 have been collected. Last year the total collection of salmon eggs at all the stations on the coast produced 37,000,000. Under wise legislation—approved by fishermen and canners alike—and propagation, the output of salmon taken from the Sacramento river is rapidly increasing—the only river on the coast that shows an increase year after year for the past six years.

—Bids for supplies for the Mare Island navy yard were opened at the Navy Department last Tuesday. The following were among the lowest bidders: Baker & Hamilton, San Francisco, hardware, $1088; Dunham, Carrigan & Hayden Co., San Francisco, brass wire, $366; Holbrook, Merrill & Stetson, San Francisco, copper wire, $417; Milton H. Cook, San Francisco, rigging, pump and bellows, $1325; A. A. Watkins, San Francisco, Russian iron sheets, $195; Holbrook, Merrill & Stetson, San Francisco, babbitt metal and solder, $387; Selby Smelting and Lead Co., San Francisco, pig iron, $3637; same company, 50,000 pounds of ingot copper, $5825; Williams, Dimond & Co., San Francisco, anti corrosive composition, $5000; W. P. Fuller & Co., 10,000 gallons lard oil, $3887; same company, lubricant and beef tallow, $221, and lamp black, $190; C. M. Gates, San Francisco, 50,000 pounds red lead, $2880; W. P. Fuller & Co., San Francisco, polishing paste, $335; same company, 5000 gallons sperm oil, $2072; Dunham, Carrigan & Hayden Co., San Francisco, water-gauge glasses, $135; Holbrook, Merrill & Stetson, San Francisco, angle, check and globe valves, $4469; Dunham, Carrigan & Hayden Co., San Francisco, files, $2238; Baker & Hamilton, San Francisco, 25,000 pounds cotton waste $1675; Remmer Aden, Vallejo, Oregon pine deck planks, $9847; Libby, McNeal & Libby, Chicago, 10,000 pounds tinned roast beef, $812; Armour Packing Co., Kansas City, 5000 pounds tinned ham, $462; J. Levi Jr., San Francisco, 5000 pounds rice, $250; S. W. Ehrman, San Francisco, 50,000 pounds sugar, $2775.

Personal.

LOUIS JANIN is in Santa Barbara, Cal.

E. KENEDY of Rossland, B. C., has gone to London.

GEO. W. GRAYSON of Oakland, Cal., is in Arizona.

W. O FROST of Placerville, Cal., is in San Francisco.

T. P. GOWER of Madera, Cal., is in San Francisco.

JAS MAIN is Supt. of the Boggs mine, Yreka, Cal.

C. W. SMITH is Supt. of the Mohawk mine, Tucson, Ariz.

W. LAWRENCE is Mgr. of the North Star, Tintic, Utah.

A. T. LAWRENCE is Mgr. of the North Star, at Tintic, Utah.

J. E. JACKSON has returned from Denver to Salt Lake City.

R. C CHAMBERS is Supt. of the Ontario at Park City, Utah.

E. J. DE SABLA JR. of Nevada City, Cal., is in San Francisco.

J. W. PAYNE, Gen. Mgr. Grand Reef mine, is in Tucson, Ariz.

W. D. ROBB is Supt. of the Wellington, near Whitewater, B. C.

C. W. TOZER of Arizona reached San Francisco last Tuesday.

R. L. DOUTHITT is Supt. of the Washington mine at Bland, N. M.

EDW. LECKIE is Mgr. of the New Goldfields mine, Rossland, B. C.

T. R. GEARHARD of El Dorado, Cal., was in San Francisco this week.

A. WILSON is Supt. of the Gage-Wilson Co., Cherokee, Butte Co., Cal.

J. M. BUFFINGTON is Supt. of La Suerte mine at Nevada City, Cal.

SUPT GIBSON of the Black Diamond, Ainsworth, B. C., has resigned.

B. E STAHL is Supt. of the Bent & Alexander mine, Ashland, Oregon.

C BIESEL is Mgr. of the Cœur d'Alene Co., at Wardner Junction, Idaho.

F. ZEITLER, Supt. Champion mine, Nevada City, Cal , is in San Francisco.

STEPHEN C. WILLIAMS, Supt. of the Star, Sonora, Cal., is in San Francisco.

J. H. O'CONNELL, Supt. of the McKinley, Sonora, Cal., is in San Francisco.

RD. PLEWMAN has been appointed Receiver of the O. K. mine, Rossland, B. C.

SUPT. PARNALL of the Old Dom. Copper Co., Globe, Ariz., has gone to Michigan.

H. M. BENNETT is Mgr. of the Dives and Shenandoah mines at Silverton, Colo.

CAPT. JAS. BLACK of Salt Lake is in California examining mother lode properties.

W. H. WESTFALL has charge of the Steger mine at West Point, Calaveras Co., Cal.

L. DAVIS, of the North Star M. & D. Co., left London last week for Rossland, B. C.

L. D. GRAETER of Montana is in San Francisco on his return from Weaverville, Cal.

CHAS. O'CONNELL, Supt. of the Boulder, Shingle Springs, Cal., is in San Francisco.

F. W. WILMANS, Pres. Boulder M. Co., has returned to San Francisco from Rescue, Cal.

CAPT W. H. MCCLINTOCK, Supt. of the Goldwin M. Co., Sonora, Cal., is in San Francisco.

G. S. MILLER, Supt. of the Portland-Alaska M Co., Seward City, Alaska, is in Portland, Oregon.

SAM W. CHENEY has returned to San Francisco from the Mammoth-Garfield, in Shasta Co., Cal.

O. S BUCKBEE, Supt. of the Confidence mine, Confidence, Cal., reached San Francisco yesterday.

A. T. CALDWELL of Portland is superintending the construction of a cyanide plant at Ashland, Oregon.

T. A. CARSON succeeds J. E. Poingdestre as Mgr. of the Good Title mine, Dobbins P. O., Yuba Co., Cal.

GEO. BLAKE, Supt. of the Bell mine, Tuttletown, Cal., is at the Waldeck Sanitarium, San Francisco.

J. B. TREADWELL, Supt. Keystone at Amador City, Cal., has returned to the mine from his trip to Oakland.

G. W. STORCK is the Mgr. of a new M. & D. Co., organized by Sioux City, Iowa, men to operate at Sonora, Mexico.

J. F. PLAGEMAN has returned to San Francisco from the Weiland mine, in Amador Co., Cal., in which he is interested.

TOM T. LANE reached San Francisco last Sunday from the City of Mexico and departed for the Utica mine, in Calaveras Co., Cal.

E C. PLATT of New York, associated with J. W. Mackay, is said to be the purchaser of the Grand Reef mine, fifty miles north of Wilcox, Ariz.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from George Reber in the Badger Hill Mine, near Placerville, El Dorado Co., to deposit tailings in Iowa Canyon; from F.W. Cook, in the Try Again Mine near Placerville, El Dorado Co., to deposit tailings in a ravine; from Matt Yoner, in the Hoosier Mine near Georgetown, El Dorado Co., to deposit tailings in Bear Creek; from Otto Reichel, in the Mountain Ranch Mine near Mountain Ranch, Calaveras Co., to deposit tailings in a ravine; from J. F. Gurney et als., in the Johnston Placer Mine near San Andreas, Calaveras Co., to deposit tailings in a ravine; and from J. G. Underwood and W. N. Lamb, in the Chris Limpher Mine near Plymouth, Amador Co., to deposit tailings in Indian Creek, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., December 27, 1897, at 1:30 P. M

FOR SALE, AT A BARGAIN.

A complete Champion Prospecting Diamond Drill Outfit. Good as new. Used very little. Does succe sful work. For price apply to GOLD HILL MINING CO., Angels Camp, Cal.

Mining Share Market.

SAN FRANCISCO, Dec. 23, 1897.

The same sick and heavy market, which has been a characterizing feature for some time past, held to Monday when Sierra Nevada showed more life and made quite an upmove on reports of an ore strike. This imparted a better tone to shares at that end Tuesday there was another slight strengthening, causing Sierra Nevada to sell up to over 80 cents, when the Gold Hill shares under the lead of Yellow Jacket stiffened slightly, which was sustained yesterday by Belcher moving up slightly. While the market shows considerable strength, yet experienced operators are suspicious that it has no further foundation than a natural rally from the extreme low prices. There can be no doubt of brokers' boxes being well cleaned out of margin shares, for holders had to let go or else take up the little left at the lower prices which have ruled for a few weeks past. Assessments coming due also helped the selling. From all we can learn, there is from two to three weeks more of work to be done in Sierra Nevada before they expect to reach the ore found above, and while the management are hopeful of a decided improvement in it, yet neither they nor any one else can see so far ahead It is a gamble. It is expected that the report of Prof. Ogden on the Brunswick lode will be submitted to-day to the different companies interested on that lode. It is a very long report and goes into the subject in all its minutiæ, from both a scientific and practical mining standpoint. They are quite confident that paying ore in quantity will be uncovered, but the work will have to be changed to the west —heretofore they have been crossdrifting to the east for the ore body. Conforming to this information, work in the Gould & Curry and Best & Belcher grounds has been started to the west. They confirm the opinion expressed in this department that in Potosi the work will eventually develop into something quite important, as it will in Occidental; more depth will be required in Savage. Taking the report as a whole—and it is by far the most important that has been made on any lode in the Comstock district for many years —if future work confirms deductions made by the two experts, we can look forward with confidence to that lode having in store for the management of two or more mines bonanzas of some importance; but it will take time and large expenditure of money before it can be demonstrated to the satisfaction of large moneyed interests—those who back their opinions by $20 pieces.

From the Comstock lode the general tenor of advices is that the work in several mines is reaching points that deserve close watching; yet it may take several weeks before the desired points are reached. In several of the mines it looks as if they are fairly well through with the foundation work for more active exploiting. If the above is correct, then we can look for a fairly good trading market for the next few weeks, which will afford splendid chances to nimble traders to turn an honest dollar. The market is evidently a gamble, for no one can tell with any degree of certainty how much, if any, ore will be developed. Official letters received the past week do not report any change in the work or material of Utah. In Sierra Nevada they are crossdrifting to the east on the Layton tunnel level, and to the west on the 900-foot Union shaft level. Fast progress is being made in the Riley tunnel. In Union they are making fair progress in east crossdrift No. 2 on the 900-foot level. They are in over 70 feet, with porphyry in the face. In Mexican the east crossdrift on the 1000-foot level is in nearly 600 feet. At last advices they were in softer porphyry, showing clay separations. The Ophir west crossdrift on the 1000-foot level is in about 700 feet. It shows vein matter and clay separations. The west crossdrift on the old Central tunnel level is in about 340 feet, with nothing in particular reported. In Con. Virginia active exploiting work is continued on the 1550-foot, 1650-foot and 1750-foot levels. Well-informed miners are quite hopeful of good results following the work now under way. They are still drifting north in Andes on the 175-foot level. They ought to be in position soon for exploiting work. Best & Belcher and Gould & Curry are still engaged in repairing the Bonner shaft. Low-grade ore from Gould & Curry is being reduced at the Kinkead mill. From Savage there is nothing new to hand. No work is being done by Hale & Norcross. Good progress is being made in repairs in the main incline in Chollar at and above the 1100-foot level. When finished, other exploiting work is expected to be started. The south drift run jointly by Potosi and Bullion was at last advices in low-grade quartz. A west drift is being run in Potosi to connect with the north stope above No. 1 crossdrift. Killtime work is still the order on the 500-foot level of Alpha. From Con. Imperial and Confidence nothing new comes to hand. Advices from Yellow Jacket report one shift only at work, but more men will probably be put on in January or February. Nothing is being done by the Kentuck people, so far as we can learn. The work in both Crown Point and Belcher is said to be closely watched, but this has been reported for the past few years, and all that came of it has been assessments. From Seg. Belcher and Overman nothing new is reported in official letters. The work in Justice ought to be nearing the point where they expected to strike the ore found above.

It looks now as if general attention will soon begin to center in the mines on the Brunswick lode. A joint west crossdrift has been started jointly by Con. Virginia, Best & Belcher and Gould & Curry on the 600-foot level to test the report of the two experts. They are also running south on this level. The west crossdrift in Gould & Curry is in about 50 feet. In Chollar work is confined to the 300-foot, 500-foot and 600-foot levels. Nothing new is reported. In Potosi on the 500-foot level they are crossdrifting west as they are in the 600-foot level. They are raising from the latter level. Active exploiting work is being done in Occidental on the 550-foot, 650-foot and 750-foot levels.

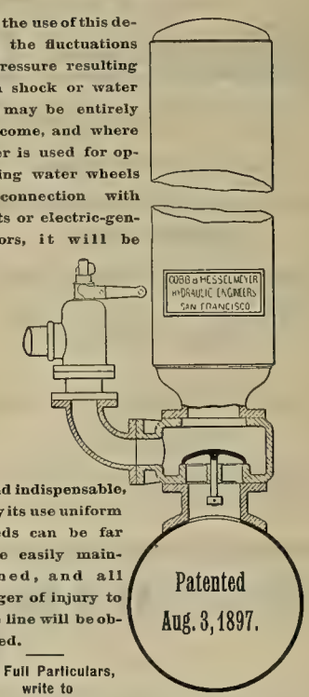
Nos. 73, 75 FIRST ST., Portland, Or.

APPARATUS
—FOR—
Regulating Pressures
—IN—
PIPE LINES

By the use of this device, the fluctuations of pressure resulting from shock or water ram may be entirely overcome, and where water is used for operating water wheels in connection with hoists or electric-generators, it will be found indispensable, as by its use uniform speeds can be far more easily maintained, and all danger of injury to pipe line will be obviated.



Patented Aug. 3, 1897.

THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,

330 Market Street.....San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.
Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Prospector's Field Book and Guide.
By H. S. Osborn.....$1 50

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....$3 00

Modern Copper Smelting.
By Edward Dyer Peters, Jr. Seventh edition. Rewritten and enlarged. Profusely illustrated....$5 00

Practical Treatise on Hydraulic Mining.
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. Price, postpaid.....$5 00

Practical Hydraulics.
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Explorer's and Assayers' Companion.
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

The Metallurgy of Gold.
By M. Eissler. Profusely illustrated.....$5 00

Notes on the Treatment of Gold Ores.
By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

Cyanide Processes for Gold and Silver Ores.
By E. B. Wilson, E. M. 12mo., cloth.....$1 50

Quartz Operator's Handbook.
By P. M. Randall.....$2 00

Skeleton Mining Report.
Of great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid.....50 cts

Stamp Milling of Gold Ores.
By T. A. Rickard, M. E. An actual record of milling practice in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions to those interested in the extraction of gold from its ores. Well illustrated. Cloth. Price, postpaid.....$2 50

Miners' Pocketbook.
A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G. Warnford Lock. 472 pages, illustrated, flexible leather.....$5 00

DEWEY, STRONG & CO.,

PATENT SOLICITORS,

330 MARKET ST., - SAN FRANCISCO, CAL.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.**

MINE BELL SIGNALS. Adopted, Used and in Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco.

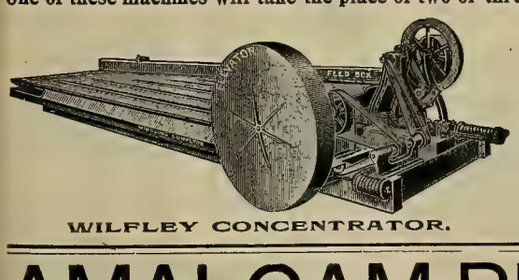
Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

PRICE $450 F. O. B. San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.



WILFLEY CONCENTRATOR.

SEND FOR CIRCULARS.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, barring none.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

PATENTS

DEWEY, STRONG & CO'S

PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

DENVER, COLO.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

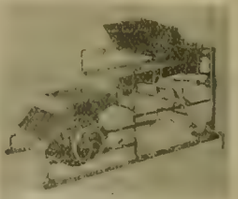
Pacific Placer Machine.



Patented APRIL 20, 1897.

KLONDIKE MACHINE.—If you are going to placer mining in Klondike or any other country, you cannot afford to be without one of these Machines. It will work any class of placer ground, river or sea sands, and save the fine float gold as well as the coarse. The material is graded in four different grades in passing through the Machine. The coarse gold is caught in the riffles above the plates; a double screen is arranged above the plate and amalgamating cylinder, allowing nothing but the water and fine material to pass onto the amalgamating plate and cylinder. This is the Machine for dry countries, as it requires but a small amount of water. By attaching one of our small pumps the Machine will supply its own water from streams or well and raise water 20 feet. One miners' inch of water will supply our larger Machine by using the water over. Will work 40 to 50 tons per day. Can be run by hand or power. Built in three sizes. Price $150, $300, $450, f. o. b. S. F. Capacity 10, 25, 40 tons per day. Weight 175 lb., 400 lb., 550 lb. Manufactured for both quartz and placer. Send for Catalog. PACIFIC MINING MACHINERY CO., 127 First St. S. F., Cal.

Assaying Gold
.....AND.....
Silver Ores.

THIRD EDITION JUST OUT.

A Standard Work.

By C. H. AARON.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the pratical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price **$1.00** postpaid. Sold by the **Mining and Scientific Press**, 330 Market St., San Francisco.

Pumping Water 68 Feet at 3-4 Cents Per 1000 Gallons — More Than Satisfactory.

OFFICE OF GEORGE M. COOLEY,
SAN BERNARDINO, CAL., July 11, 1896.

WEBER GAS & GASOLINE ENGINE CO.,
KANSAS CITY, MO.

GENTLEMEN—I wish to make the following statement regarding the use of distillate in the "Weber" Engine. I connected up my No. 4 "Weber" for distillate, as per your instructions, and find it to be more than satisfactory. In making th test I pumped 108 000 gallons of water at a cost of three-quarters of a cent per 1000 gallons, raising the water sixty-eight feet. This, I think, is a good showing, and one that will make many friends for the "Weber." Yours very truly, GEORGE M. COOLEY.

Market Reports.

The Markets.

SAN FRANCISCO, Dec. 23, 1897.

General trade is no different from the holiday weeks of former years. The demand for goods is confined to actual wants, for merchants prefer not to buy much until after the turn of the year. We notice that, considerable goods on which there will be higher freights have been taken by jobbers in expectation that better prices will rule. The prevailing opinion is that large numbers of persons and companies for Alaska will outfit in this city, where cheaper and better supplies can be had owing to our trade being largely with mining districts. With iron workers the opinion prevails that we will get the lion's share of business owing to our foundry men and machine men being better fitted to turn out desired tools and machinery.

The local money market continues to work on easy lines, with funds accumulating, considerable of which is held for disbursement next month. It is quite generally accepted that disbursements in January will be larger than ever before in the corresponding month. Much of this increase will come from dividends by incorporated companies. The disbursements by State, national and municipal authorities in this city will be in excess of former years. The East continues to report easy money markets. It is authoritatively reported that large sums of American funds have been placed in Europe owing to a better rate of interest. This goes far to show the growth of this country in creating wealth.

New York Silver Prices.

NEW YORK, Dec. 23. — Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	25 15-16	56⅛
Saturday	25 15-16	56
Monday	26 1-16	56⅛
Tuesday	26¼	57
Wednesday	26 5-16	57
Thursday	26½	57⅜

	Copper.	Lead.	Iron.	Tin.
Fri.	10 87½@11 00	3 72½	10 00@12 25	13 70
Sat.	10 87½@11 00	3 70	10 00@12 25	13 70
Mon.	10 90 @11 00	3 70	10 00@12 25	13 67½
Tue.	10 90 @11 00	3 72½	10 00@12 25	13 67½
Wed.	10 90 @11 00	3 72½	10 00@12 25	13 65
Thur.	10 90 @11 00	3 70	10 00@12 25	13 65

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	6
Commercial Loans, prime	5
Call Loans gilt edged	4@4½
Call Loans mixed securities	5@6
Mortgages prime, taxes paid by lender	6@8
New York Sight Draft	12½c Prem
New York Telegraphic Transfer	15c Prem
London Bankers' 60 days	$4.83¾
London Merchants	$4.82½
London Sight Bankers	$4.86¼
Refined Silver, per oz. 1000 fine	57⅜
Mexican Dollars nominal	47@—

SILVER.—The market, after settling down to 56 cents per ounce fine, commenced to strengthen. The ups and downs are hard to forecast. They either show the market is being manipulated at London for still higher prices or else the available supply is well concentrated, and any buying demand shows itself in stiffer figures. Good crop prospects in Argentine and also in India may possibly exert a favorable influence on the market, particularly in the latter country, for it points to a better demand. It is rather singular that India and Russia are the only countries that have increased their imports; the others show a falling off. One cause of the increase by the former is that there has been a decided falling off in Council bills. With liberal supplies of the latter, exchange wants are largely met without sending silver there.

MEXICAN DOLLARS.—The market holds to fairly steady prices. The last steamer for China took out over 550,000.

COPPER.—The market has ruled quiet, but steady. The East reports a fairly firm market for the closing weeks of the year.

Our market is quoted as follows:

Ingot casting, jobbing	13 @—
Ingot " wholesale	12½@—
Sheet copper	— @16½
Bolt	¼ and 5-16, 20c; ⅜ and larger, 16½

TIN.—The market is quiet for both pig and plate on spot, but for forward delivery considerable business has passed. The general tendency seems to be to easy figures.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " light, "	4 00@—

SHOT.—The market is steady.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 40
Drop, B and larger sizes, " "	1 65
Buck, Balls and Chilled, do, " "	1 65

POWDER.—There is nothing new to report in our market.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¼c, according to strength and quantity; No. 2, from 9 to 11c, according to strength and quantity.

QUICKSILVER.—The past week shipments aggregated 125 flasks to Central America and 200 flasks to Mexico. These are the largest single week shipments for over a year. The market is firm.

Our market is quoted at $39 for domestic consumption and $35@36 for export to the west coast of Mexico.

LEAD.—The market is quiet but steady. The East reports considerable inquiry for round parcels for delivery next year, but buyers' views are below sellers'.

Our market is quoted in jobbing lots as follows per 100 pounds:

Pig	4 75 @	5 00
Sheet	6 30 @	6 80
Pipe	5 60 @	6 10

IRON.—Unless all advices are misleading, the consumption of pig next year on this coast and at the East will be the largest on record. Contract sales for delivery well into 1898 have been made by furnace men at the East.

AMERICAN.

	To Arrive.	Spot.
Sloss	$20 00	$22 00
Thomas	21 00	22 00
Salisbury	29 00	31 50

ENGLISH.

Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

NAILS.—The market is firm at an advance.

We quote the following basis: 20d to 60d, inclusive—wire $2.60, cut $2.50.

COAL.—Suits in the Federal courts against the coal combine have not as yet had any visible effect. The consumption is quite heavy, owing to extreme cold weather.

Receipts of Coal for the week ending Tuesday were as follows in tons. Puget Sound, 11,140; Nanaimo, 3389; Comox, 3810; Newcastle, N. S. W., 5882; Departure Bay, 11,504. Total, 36,225.

COKE.—The consumption promises to be larger next year than it has been this year.

The market is quoted as follows:

Gas Companies'	— —		— —
English, to load	— —	@	— —
" spot, in bulk	11 00	@	— —
" in sacks	12 00	@	— —
Cumberland	10 00	@	— —

PLATINUM.—The market is steady.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

BORAX.—Our market is strong. Notwithstanding heavy shipments to the East, New York advices state that supplies are light and market stiff.

The market is quoted as follows:

Refined, in carload lots, in barrels	6
Refined, in carload lots in sacks	5¾
Powdered, in car lots	6¼
Concentrated, "	5½

ZINC.—The market is firm.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

ANTIMONY.—The market is steady.

Our market is quoted at 8¼c in a jobbing way. New York mail advices quote 8c for Cookson's, 7½c for Hallett's and 7c for Japanese.

Chemicals.

The year is going out on a very quiet market, with a light trade reported. It is stated that cheap purchases are well exhausted and new business will be the order early in 1898. When this obtains it is quite likely that stiffer prices will rule. There are no changes reported in anything. Eastern advices report quiet markets, with no change in prices that have been current for some time.

SULPHURIC ACID.—The demand is quiet.

We quote in a jobbing way at 1½c per lb for 66%.

ACETIC ACID.—The market is steady at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported firm from store at 6⅞@7c per pound in carboys.

BONEASH.—There is a slow demand.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

BLUE VITRIOL.—Our market is steady, with better inquiry.

We quote in a jobbing way at 4c per pound.

SPELTER.—The market is steady.

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is firmer.

Our market is quoted in a jobbing way at $1.40 a pound.

SODA ASH, 58% (LeBlanc process).—The market is steady at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is steadier at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—The market is quiet at 2½c a pound from stores.

NITRATE OF SODA. — The market is quiet, with a steadier tone.

Our market is quoted from store at 4c for 95%.

PHOSPHORUS.—The market is steady.

We quote in a jobbing way at 70 to 75 cents per pound.
